

ABSTRACT

BASEBAND DATA TRANSMISSION METHOD AND SYSTEM

5 A baseband data transmission method and system are provided. The system includes a first sending path and a second sending path that have different performance indicators. A first switching unit selects an output of one of the sending paths based on a type of a to-be-transmitted data packet, and sends the output to a sender. In this way, when there is to-be-transmitted data of a plurality of different types, the output of the appropriate sending path may be selected by using
10 the first switching unit without rebooting the data transmission system or performing link renegotiation, so that hybrid transmission of data packets of a plurality of types in the system is implemented.
