

INFORMATION PROCESSING SYSTEM AND INFORMATION PROCESSING
METHOD
ABSTRACT

In one aspect of the present disclosure, with respect to a plurality of sections defined by subdividing a feature space, section information describing, for each of the sections, features of a set of entities of a corresponding section is acquired from a storage device storing the section information. A second feature value related to a focus target entity is acquired. A section with which the focus target entity is associated in the feature space is determined as a target section. For each of the sections in the feature space, definition information defining a delivery condition for a delivery system is stored. The delivery system is requested to perform a delivery in accordance with the delivery condition defined for the target section.
