

ELECTRONIC METHODS AND SYSTEMS FOR CAB BOOKING WHILE PERFORMING PAYMENT TRANSACTION FOR A PURCHASE

ABSTRACT

Embodiments provide methods and systems for booking a cab for a user by a merchant at a merchant terminal. The method includes electronically facilitating, by the merchant terminal, cab booking option for the user by the merchant while generating a purchase bill for the user. The merchant terminal sends a booking request to a cab reservation system to book the cab. The booking request includes a pre-booking amount for booking the cab, a pre-determined pick-up location of the user corresponding to location of a merchant facility of the merchant and a contact number of the user. The cab reservation system provides a booking confirmation to the merchant terminal upon booking the cab. After receiving the confirmation, the merchant terminal sends a payment transaction request for the purchase bill and the pre-booking amount. Thus, the purchase bill generated for the user is inclusive of commuting cost, *i.e.*, the pre-booking amount.
