

Printing via kickstart function**ABSTRACT**

- 5 A method of controlling document processing in a networked system and a digital image reproduction device for document processing are described. The system has workstations for submitting processing jobs of a user, and a memory unit for managing the jobs that are waiting to be executed. The method includes providing, at a user interface (40) of the digital image reproduction device, control elements (44,45) for a
- 10 user to select a processing job from the processing jobs in a logical storage space; and executing the selected processing job. Kickstart processing jobs are selected, based on predetermined kickstart criteria, from the processing jobs in the memory unit, and a corresponding set of kickstart control elements (41) is provided at the user interface, each coupled to a respective one of the selected kickstart processing jobs.
- 15 When a kickstart control element is activated by a user, the associated kickstart processing job is directly initiated.
