

Abstract

Provided is a method for producing a quaternary ammonium compound aqueous solution, said method being characterized in that: the quaternary ammonium compound aqueous solution contains not more than 1,000 ppm of organic impurities that have a molecular weight of not less than 1,000 g/mole; and a raw quaternary ammonium compound aqueous solution that contains specific quaternary ammonium ions and that contains metal impurities is brought into contact with a cation exchange resin which has a crosslinking degree of not less than 6 and counter ions of which are non-metal ions.
