

FOLDABLE ELECTRONIC DEVICE COMPRISING ANTENNA

【ABSTRACT】

According to various embodiments of the present disclosure, provided is a foldable electronic device comprising: a first housing having a first part disposed therein; a second housing having a second part disposed therein; a hinge module rotatably connecting the first housing to the second housing; a flexible display which is disposed from one surface of the first housing across a region, in which the hinge module is disposed, and to one surface of the second housing; and a coupler for transmitting a signal between the first part and the second part, wherein the coupler includes: a first coupling member electrically connected to the first part; and
5 a second coupling member which is electrically connected to the second part, and is located, in a first state of the electronic device, at a position corresponding to the first coupling member so as to be coupled to the first coupling member and transmit or receive a signal with respect to the first coupling member. Various other embodiments can be applied.
