

CUTTING APPARATUS AND METHOD FOR MANUFACTURING CUT ARTICLE

ABSTRACT

5 Provided is a cutting apparatus capable of discharging end materials more reliably.
This cutting apparatus includes: a machining table which is movable along a linear moving
direction; a cutting mechanism which cuts an object to be cut placed on the machining table; a
receiving member which is formed along the moving direction below the machining table, and
which has a groove portion capable of receiving end materials generated when the object to be
10 cut is cut by the cutting mechanism; a mobile body which is movable along the moving
direction; and a removing member which is provided on the mobile body, which is arranged to
contact the groove portion, and which removes the end materials from the groove portion.
