

NON-INVASIVE QUANTITATIVE MULTILAYER ASSESSMENT METHOD AND RESULTING MULTILAYER COMPONENT

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application is a continuation-in-part patent application of U.S. Patent Application
5 No. 16/701,243 filed December 3, 2019, which claims the benefit of European Patent
Application No. 18210779.7 filed December 6, 2018, the disclosures of which are herein
incorporated by reference in their entirety.

BACKGROUND OF THE INVENTION

10 [0002] The disclosure relates generally to non-destructive material testing, and more
particularly, to a method of analyzing quantitative data about layer(s) of a multilayer
component, and a resulting multilayer component.

[0003] Quantitative investigations and quality checks of materials properties are oftentimes
required to determine, for example, an applied coating thickness, a depletion level, etc. Such
15 assessments are oftentimes required for process qualification, regular production monitoring,
determining the remaining lifetime for a multilayer component or as an initial assessment to
determine the scope of a repair for a multilayer component. In order to conduct these
assessments, a cut up is taken from a commercial component. Consequently, the component
is destroyed (scrapped) and needs to be replaced by a new part. Limited non-destructive tests
20 are available to assess, e.g., interface delamination or layer thicknesses with thermography,
etc. for ceramic layers on metallic substrates. However, these approaches lack the ability to
provide quantitative data regarding lifetime relevant properties, and in particular, depletion of
a bond coat. In addition, such assessments cannot be performed on-site (neither in-situ nor on
a dismantled part).

25

BRIEF DESCRIPTION OF THE INVENTION

[0004] A first aspect of the disclosure provides a method of analyzing layer thickness of a
multilayer component, the method comprising: creating an opening having a predefined
geometry partially into the multilayer component at a selected location on a surface of the
30 multilayer component, wherein the multilayer component includes a plurality of material

layers including a substrate and a bond coat and the opening exposes each of the plurality of material layers including the substrate; creating an image of the exposed plurality of material layers in the opening using a digital microscope; and calculating at least a thickness of the bond coat of the exposed plurality of material layers from the image and based on the predefined geometry of the opening.

[0005] A second aspect of the disclosure provides a multilayer component, comprising: a substrate; a bond coat over the substrate; a thermal barrier coating (TBC) layer over the bond coat, the TBC layer having a first outer surface having indication of exposure to a hot gas path environment; and a filled opening in the substrate, the bond coat and the TBC layer, the filled opening including: a substrate repair fill filling the filled opening in the substrate; a bond coat repair fill filling the filled opening in the bond coat, and a thermal barrier coating (TBC) plug filling the filled opening in the TBC layer, the TBC plug having a second outer surface having no or less indication of exposure to the hot gas path environment.

[0006] A third aspect of the disclosure includes a method of analyzing layer thickness of a multilayer component, the method comprising: drilling to create an opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component includes a plurality of material layers including a substrate, a bond coat over the substrate, and wherein the opening exposes each of the plurality of material layers; increasing a contrast of the exposed plurality of material layers exclusively in the opening from that present after the opening creating by polishing the exposed plurality of material layers, and etching the exposed plurality of material layers; creating an image of the exposed plurality of material layers in the opening using a digital microscope; calculating at least a thickness of the bond coat from the image and based on the predefined geometry of the opening; and repairing the opening, allowing the multilayer component to be used for an intended purpose thereof.

[0007] A fourth aspect of the disclosure includes an automated system for analyzing layer thickness of a multilayer component, the automated system comprising: a manipulator coupled to: an opening forming device configured to create an opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component comprises a plurality of material layers including at least a substrate and a bond coat, and wherein the opening exposes each of

the plurality of material layers; and an imaging device configured to create an image of the exposed plurality of material layers in the opening; and a processor configured to calculate at least a thickness of the bond coat of the exposed plurality of material layers from the image and based on the predefined geometry of the opening.

- 5 [0008] A fifth aspect of the disclosure includes a method of analyzing layer thickness of a multilayer component with an automated system comprising a manipulator and a processor, the method comprising: receiving at the manipulator of the automated system the multilayer component; creating an opening with an opening forming device coupled to the manipulator, the opening having a predefined geometry partially into the multilayer component at a
10 selected location on a surface of the multilayer component, wherein the multilayer component comprises a plurality of material layers including at least a substrate and a bond coat, and wherein the opening exposes each of the plurality of material layers; creating with an imaging device coupled to the manipulator an image of the exposed plurality of material layers in the opening; and calculating with the processor of the automated system at least a thickness of the
15 bond coat of the exposed plurality of material layers from the image and based on the predefined geometry of the opening.

- [0009] A sixth aspect of the disclosure includes a method of repairing a multilayer component with an automated system comprising a manipulator and a processor, the method comprising: receiving at the manipulator of the automated system the multilayer component; creating an
20 opening with an opening forming device coupled to the manipulator, the opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component comprises a plurality of material layers including at least a substrate and a bond coat, and wherein the opening exposes each of the plurality of material layers; creating with an imaging device coupled to
25 the manipulator an image of the exposed plurality of material layers in the opening; calculating with the processor of the automated system at least a thickness of the bond coat of the exposed plurality of material layers from the image and based on the predefined geometry of the opening; and repairing with the repairing device coupled to the manipulator of the automated system the opening.

30 BRIEF DESCRIPTION OF THE DRAWINGS

[0010] These and other features of this disclosure will be more readily understood from the

following detailed description of the various aspects of the disclosure taken in conjunction with the accompanying drawings that depict various embodiments of the disclosure, in which:
[0011] FIG. 1 shows a perspective view of an illustrative multilayer component in the form of a turbine blade.

5 [0012] FIG. 2 shows a cross-sectional view of illustrative layers of a multilayer component.

[0013] FIG. 3 shows a cross-sectional view of creating an opening according to one embodiment of the disclosure.

[0014] FIG. 4 shows a cross-sectional view of creating an opening according to another embodiment of the disclosure.

10 [0015] FIG. 5 shows a cross-sectional view of optionally increasing the contrast of the layers in the opening according to one embodiment of the disclosure.

[0016] FIG. 6 shows a cross-sectional view of creating an image of the layers in the opening according to one embodiment of the disclosure.

15 [0017] FIG. 7 shows an illustrative image of the layers in an opening according to one embodiment of the disclosure.

[0018] FIG. 8 shows a schematic view of layers of the opening for calculating layer thicknesses according to an embodiment of the disclosure.

[0019] FIG. 9 shows a cross-sectional view of layers of a repaired multilayer component according to an embodiment of the disclosure.

20 [0020] FIG. 10 shows a cross-sectional view of layers of a repaired multilayer component according to another embodiment of the disclosure.

[0021] FIG. 11 shows a block diagram of an example automated system according to an embodiment of the disclosure.

25 [0022] FIG. 12 shows a flow diagram of an example automated method according to an embodiment of the disclosure.

[0023] FIG. 13 shows a flow diagram of a second example automated method according to an embodiment of the disclosure.

[0024] FIG. 14 shows a flow diagram of a third example automated method according to an embodiment of the disclosure.

30 [0025] It is noted that the drawings of the disclosure are not to scale. The drawings are intended to depict only typical aspects of the disclosure, and therefore should not be

considered as limiting the scope of the disclosure. In the drawings, like numbering represents like elements between the drawings.

DETAILED DESCRIPTION OF THE INVENTION

5 [0026] As an initial matter, in order to clearly describe the current disclosure it will become necessary to select certain terminology when referring to and describing relevant parts of a multilayer component. When doing this, if possible, common industry terminology will be used and employed in a manner consistent with its accepted meaning. Unless otherwise stated, such terminology should be given a broad interpretation consistent with the context of
10 the present application and the scope of the appended claims. Those of ordinary skill in the art will appreciate that often a particular component may be referred to using several different or overlapping terms. What may be described herein as being a single part may include and be referenced in another context as consisting of multiple components. Alternatively, what may be described herein as including multiple components may be referred to elsewhere as a
15 single part.

[0027] Where an element or layer is referred to as being “on,” “engaged to,” “disengaged from,” “connected to” or “coupled to” another element or layer, it may be directly on, engaged, connected or coupled to the other element or layer, or intervening elements or layers may be present. In contrast, when an element is referred to as being “directly on,” “directly
20 engaged to,” “directly connected to” or “directly coupled to” another element or layer, there may be no intervening elements or layers present. Other words used to describe the relationship between elements should be interpreted in a like fashion (e.g., “between” versus “directly between,” “adjacent” versus “directly adjacent,” etc.). As used herein, the term “and/or” includes any and all combinations of one or more of the associated listed items.

25 [0028] Embodiments of the disclosure provide a method to analyze quantitative data, like layer thickness, of a multilayer component. The method obtains the required quantitative data with a mini-invasive impact of a multilayer component. In particular, an opening is created in the multilayer component that can be fully restored, where necessary, using available (local) repair procedures while enabling the reuse of the commercial multilayer component. In
30 addition, the component assessment can be performed during component manufacture and at the site of use. The component can be repaired on-site using on-site repair solutions.

[0029] FIG. 1 shows a perspective view of an illustrative multilayer component 100 in the form of a turbine blade. The teachings of the disclosure can be applied to any multilayer component made using any method of formation of the layers, e.g., welding, brazing, thermal spray, etc. As shown in the cross-sectional view of FIG. 2, multilayer component 100 may include a plurality of material layers. In the example shown, one or more protective layers 106 may be over substrate 104. Substrate 104 may include any metal or metal alloy that acts as a metal substrate, or a ceramic such as ceramic matrix composite. For purposes of a turbine blade, substrate 104 may include, for example, a superalloy, which may refer to an alloy having numerous excellent physical characteristics compared to conventional alloys, such as but not limited to: high mechanical strength, high thermal creep deformation resistance, etc. Superalloys include but are not limited to: Rene 108, CM247, Haynes alloys, Incolloy, MP98T, TMS alloys, CMSX single crystal alloys, N5, GTD 444, MarM 247 and IN 738. Alternatively, substrate 104 can include a variety of other metals or metal alloys.

“Gamma prime” (γ') is the primary strengthening phase in nickel-based alloys. Example high gamma prime superalloys include but are not limited to: Rene 108, N5, GTD 444, MarM 247 and IN 738. In one embodiment, bond coat 110 may include a gamma-gamma prime structure (e.g., γ' phase $[\text{Ni}_3(\text{Al}, \text{Ti})]$ phase in gamma matrix $\gamma\text{-Ni}(\text{Co}, \text{Cr})$), and in another embodiment, substrate 104 may include a gamma-beta structure, e.g., $\beta\text{-NiAl}$ phase in gamma matrix $\gamma\text{-Ni}(\text{Co}, \text{Cr})$. In terms of ceramic, substrate 104 can include any now known or later developed ceramic configured to perform in the hot gas path environment.

[0030] Protective layer(s) 106 may include any now known or later developed protective layer for, for example, protecting substrate 104 from a hot, corrosive environment. In one embodiment, protective layer(s) 106 may include at least one of a bond coat 110 (also known as an overlay coat if used alone), and a top coat 112 over the bond coat (note, “top coat” does not necessarily indicate layer 112 as the outermost coating). Bond coat 110 may include any now known or later developed bond coat material such as but not limited to: nickel or platinum aluminides, nickel chromium aluminum yttrium (NiCrAlY) or nickel cobalt chromium aluminum yttrium (NiCoCrAlY). Bond coat 110 may include a gamma-gamma prime structure (e.g., γ' phase $[\text{Ni}_3(\text{Al}, \text{Ti})]$ phase in gamma matrix $\gamma\text{-Ni}(\text{Co}, \text{Cr})$). In one embodiment, bond coat 110 may include a metal (M) with chromium-aluminum-yttrium alloy (MCrAlY) such as those commercially available from Amdry as model numbers 4522A, and

4522C. Bond coat 110 may be applied using, for example, a high velocity oxygen fuel (HVOF) application, a low pressure plasma spraying (LPPS) or an atmospheric plasma spraying (APS).

[0031] A thermal barrier coating (TBC) layer 114 may be provided over bond coat 110. TBC layer 114 material may include, for example, yttria-stabilized zirconia (YSZ), mullite and alumina.

[0032] During operation, as shown in FIG. 3, elements may diffuse from bond coat 110, creating a depletion layer 118, some of which may eventually oxidize, creating a thermally grown oxide layer 116 (hereinafter "oxide layer 116"). Depending on substrate 104 composition and how bond coat 110 is formed, oxide layer 116 may or may not be formed during operation by diffusion of aluminum, e.g., γ' phase [Ni₃(Al, Ti)] phase in gamma matrix γ -Ni(Co,Cr) from bond coat 110.

[0033] Three example arrangements of substrate 104 and bond coat 110 for which embodiments of the disclosure are advantageous include the following. A) Substrate 104 with a MCrAlY bond coat 110 of gamma-gamma prime structure applied by HVOF or LPPS, which exhibits depletion in bond coat 110, creating depletion layer 118, that is identifiable using the teachings of the disclosure. Here, for example, aluminum diffuses and oxidized to form oxide layer 116. Embodiments of the disclosure allow for measurement of the depletion of bond coat 110. B) Substrate 104 with a MCrAlY bond coat 110 of gamma-beta structure applied by APS. Here, as shown in FIG. 4, no depletion occurs and only bond coat 110 thickness is measured using embodiments of the disclosure, i.e., because degradation of bond coat 110 cannot be measured with this method. C) Substrate 104 with a MCrAlY bond coat 110 of gamma-beta structure applied by HVOF or LPPS. This latter arrangement exhibits depletion layer 118 in bond coat 110, as shown in FIG. 3, due to operation (like arrangement A) that is identifiable using the teachings of the disclosure, i.e., aluminum diffuses and oxidizes to form oxide layer 116. While two to three protective layers 106 have been illustrated, it is emphasized that the teachings of the disclosure are applicable to any number of layers and various diffusing element(s). Materials other than TBC can also be employed.

[0034] FIGS. 3 and 4 also show creating an opening 120, i.e., a test site opening, having a predefined geometry partially into multilayer component 100 at a selected location on a surface of the multilayer component 100. Prior to forming opening 120, in most cases as

shown in FIG. 3, at least a portion of TBC layer 114 is removed, e.g., by grit or sand blasting. Only an area of TBC layer 114 necessary to create opening 120, e.g., by drilling, needs to be removed. That is, not all of TBC layer 114 needs to be removed, only an area slightly larger than an area of a tool used to make opening 120. Opening 120 can be created in a number of ways to form a predefined geometry in multilayer component 100. In one embodiment, shown in FIG. 3, opening 120 is created by drilling to create a cone-shaped hole 122. Other holes of varying shape are also possible. For example, FIG. 4 shows an opening 120 created by calotte grinding to create a spherical segment opening 124. Other material removal tools, e.g., a milling tool, can also be used to create a predefined geometry in multilayer component 100. “Predefined geometry” may include any shape for which the points, lines, surfaces, angles, lengths and other dimensions are known. As will be described, the predefined geometry allows dimensions obtained from an image of opening 120 to be used to calculate quantitative data about layers and in particular bond coat 110, such as but not limited to: layer thicknesses, a depletion level, an inter-diffusion level, or the existence of a heat affected zone. In one example of the FIG. 3 embodiment, a drill bit may have a precise point angle between approximately 130 and 150°, and a diameter of, for example, approximately 2.5 millimeters to 7 millimeters. A location of opening 120 can be user selected to, for example, provide visual assessment of the components (new-make/after use) and define material properties, where desired. More than one opening 120 can be used to test various localized areas of multilayer component 100. Dependent on component condition, different parameters can be assessed at different locations without the conventional limitations based on a specified cut-up plan for the component that would be required if destructive testing was used. Masks (not shown) can be used for regular checks at reproducible locations.

[0035] As shown in FIG. 5 for the FIG. 3 drilling embodiment, opening 120 exposes each of material layers 104, 110 (116, 118 where present) including substrate 104. That is, at least some portion of each layer 104, 110 (116, 118 where present) is revealed by opening 120, e.g., a surface, a corner, an edge, etc. An opening 120 size may be based on a variety of factors such as but not limited to: coating thickness, expected worst case wall penetration thickness, minimum and/or maximum thickness of opening 120 desired, etc. An appropriate drill bit diameter and angle may be selected based on any of those factor(s). Substrate 104 should be exposed to a minimal degree, and should be so exposed in a manner to not create a

crack or other extensive damage therein. Drilling speed and down pressure are precisely controlled to achieve the above situation.

[0036] In some cases, it is beneficial to increase the contrast compared to that present after opening 120 is created. FIG. 5 also shows optionally increasing a contrast of the exposed plurality of material layers 104, 110, 118 exclusively in opening 120. In one embodiment, the process can include polishing the exposed plurality of material layers 104, 106. This process may include, for example, polishing using a felt 140 with a diamond paste 142. In this case, increasing the contrast may also optionally include etching 144 the exposed plurality of material layers 104, 106, e.g., after polishing. The etching may include using any now known or later developed etchant such as but not limited to: a molybdenic-etchant for aluminum rich phases, or Murakami-etchant for chromium rich phases. The surface contrast can also be enhanced by electrochemical etching. Polishing may be advantageous, for example, where bond coat 110 is depleted, such as in arrangements A) and C), described herein. In this fashion, embodiments of the disclosure can attain bond coat 110 thickness and depletion layer 118 thickness, i.e., how much of bond coat 110 is diffused forming a depletion layer 118 (and oxide layer 116) and how much remains as bond coat 110. The depletion layer 118 thickness and the bond coat 110 thickness can be related to remaining lifetime of bond coat 110, i.e., life expectancy of bond coat 110. In other embodiments, it is not necessary to increase the contrast, i.e., there is no polishing or etching performed. This latter process may be applied to certain bond coats 110 that are not depleted, e.g., any deterioration is due to inner oxidation such as with arrangement B), described herein.

[0037] FIG. 6 shows creating an image of exposed plurality of material layers 104, 106 in opening 120 using a digital microscope 150, e.g., a handheld and portable version. Digital microscope 150 may include any now known or later developed microscope. In one embodiment, digital microscope 150 can be handheld and portable so it can be used in the field of use of multilayer component, e.g., inside a turbine.

[0038] FIG. 7 shows an example image 152 of opening 120 and the exposed material layers for a used multilayer component 100. It is understood that a newly manufactured multilayer component 100 would only have bond coat 110 and substrate 104 present. A depth or thickness of bond coat 110 can be calculated from image 152 based on the predefined geometry of opening 120. FIG. 8 shows a schematic of dimensions pulled from image 152

for opening 120 in FIG. 6, e.g., lateral diameters of layers d_1 , d_2 and d_3 of layers 104, 110, 118, respectively. The predefined geometry of opening 120 provides a known angle α of exposed surfaces of layers 104, 110, 118. Application of trigonometry leads to $T1 = ((d_2/2) - (d_1/2))\tan\beta$, and $T2 = ((d_3/2) - (d_2/2))\tan\beta$. Angle β is the angle of opening 120 relative to horizontal. Thus, the thickness of bond coat 110 ($T1$) can be determined. Further, where present, a thickness of depletion layer 118 ($T2$) can be determined. The thickness of depletion layer 118 ($T2$) indicates an amount of depletion of bond coat 110. That is, thickness of depletion layer 118 can be used to determine the remaining life (life expectancy) of bond coat 110.

10 [0039] Based on the calculated thickness(es), determinations of quantitative data can be ascertained such as but not limited to: bond coat 110 thickness, i.e., intact bond coat 110 thickness, and depletion layer 118 thickness resulting from the diffusion process. For new manufacture, a thickness of bond coat 110 can be used to confirm, for example, the quality of the product and to benchmark bond coat thickness for later evaluation. For used multilayer

15 components 100, the amount of depletion of bond coat 110 can be used, for example, to project remaining life expectancy using conventional algorithmic or empirically based modeling techniques. For example, for a known bond coat material, if 50% of bond coat 110 is used, it may indicate it has 1200 operating hours left under expected operating conditions of multilayer component 100. Further, the thickness of bond coat 110 and/or the thickness of

20 depletion layer 118 can also be used to determine life expectancy of bond coat 110.

[0040] In contrast to conventional destructive material testing, multilayer component 100 can be assessed, and can be repaired, where necessary. That is, opening 120 can be repaired, allowing multilayer component 100 to be used for an intended purpose thereof, e.g., as an airfoil. The repairing process can include any now known or later developed repair processes

25 for an opening 120 in the materials provided. For example, substrate 104 and bond coat 110 repair may include at least one of laser wire welding or tungsten inert gas (TIG) welding. The repairing device may be handheld. Alternatively, substrate 104 and/or bond coat 110 may be repaired by a thermal spray process, e.g., APS, flame spraying, etc. TBC layer 114 repair may include any thermal spray process such as one of APS and flame spraying. Alternatively,

30 TBC 114 may include a slurry coating process. Oxide layer 116 is not repaired. FIG. 9 shows opening 120 (for FIG. 3 embodiment) repaired.

[0041] As noted, embodiments of the method described herein may be performed prior to use of the multilayer component 100, i.e., after manufacture, to confirm proper fabrication and/or benchmark layer thicknesses. Alternatively, embodiments of the disclosure can be performed at a geographic location of use of multilayer component 100, e.g., a power plant in the case of a turbine rotor blade. Where multilayer component 100 is on site, it can be dismounted from its use setting, or it can remain in its use setting, e.g., inside a turbine. If it remains in place, multilayer component 100 can be used after the repairing of opening 120, e.g., without reinstallation. If on site, the repairing of opening 120 may include using at least one handheld device, e.g., TIG welder, flame spray, etc.

[0042] FIG. 9 shows a cross-sectional view of a used (i.e., ex-service) multilayer component 100 after exposure to methods according to embodiments of the disclosure. Multilayer component 100 may include a substrate 104, a bond coat 110 over substrate 104, and a TBC layer 114 over bond coat 110. TBC layer 114 has a first outer surface 170 having indications of exposure to a hot gas path environment, e.g., from use in a gas turbine. That is, first outer surface 170 may be, for example, dirty, worn, and/or have a different color or shade. A filled opening 172 is in substrate 104, bond coat 110 and, where provided, TBC layer 114. Oxide layer 116 and/or depletion layer 118 may exist outside of filled opening 172. Filled opening 172 includes a substrate repair fill 164, including material that is either identical to or similar to (perhaps better properties) the metal of substrate 104, that fills filled opening 172 in substrate 104, i.e., in a substrate portion 160 of opening 120. Multilayer component 100 also includes a bond coat repair fill 174 filling filled opening 172 in bond coat 110, i.e., in a bond coat portion 168 of opening 120. Bond coat repair fill 174 includes material either identical or similar to (perhaps better properties) bond coat 110. As shown, since opening 120 in substrate 104 is very small, substrate repair fill 164 may be the same material as bond coat repair fill 174, i.e., repair fill 164 and 174 are the same. In this situation, bond coat repair fill 174 extends into substrate 104. A thermal barrier coating (TBC) plug 176 fills filled opening 172 in TBC layer 114, i.e., where TBC layer 114 was removed. TBC plug 176 has a second outer surface 176 having no or less indications of exposure than first outer surface 170 of TBC layer 114 since it has not seen an operation atmosphere and temperature or has been applied with a different manufacturing process, i.e., it is newer (maybe with slightly different properties e.g. porosity) and has less dirt thereon, and may have a different color/shading than

TBC layer 114. Either of TBC plug 176 (shown) or bond coat repair fill 174 may fill filled opening 172 in oxide layer 116 and/or depletion layer 118. In the FIG. 9 example, opening 120 has a periphery having at least a portion with a cone-shape. It is understood that where opening 120 according to the FIG. 4 embodiment is employed, opening 120 would have a periphery having at least a spherical shaped portion. In any event, however, as shown in FIG. 9, the periphery of opening 120 is invisible to the naked eye in an outermost layer, e.g., TBC layer 114 and TBC plug 176. A final repair process may include contouring outer surfaces 170, 176 of multilayer component 100, e.g., by grinding or polishing.

[0043] FIG. 10 shows another embodiment in which the repair includes only repairing substrate 104 with substrate repair fill 164, and bond coat 110 with bond coat repair fill 174, in filled opening 172. Here, depletion layer 118, oxide layer 116 and TBC layer 114 are not present. Again, since opening 120 in substrate 104 is very small, substrate repair fill 164 may be the same material as bond coat repair fill 174, i.e., repair fill 164 and 174 are the same. TBC layer 114 is not provided or repaired. A final repair process may include contouring a surface 154 of multilayer component 100, e.g., by grinding or polishing. In FIG. 10, opening 120 existence is invisible to the naked eye on surface 154. However, if cut open, remnants of opening 120 may be observed in multilayer component 100.

[0044] Embodiments of the disclosure provide quantitative assessment (e.g., thickness, depletion, bonding, heat affected zone, etc.) of a multilayer component (e.g., substrate with coating, brazing, welding, etc.) having a minimal destructive impact on the commercial component while enabling its reuse by a localized material restoration, where necessary. The method thus avoids full metallurgical investigation by sectioning/destruction of commercial parts, and avoids scrap-parts for metallurgical investigation of multilayer components. In addition, the methods allow for condition-based repair, and enables repair scope reduction compared to destructive testing techniques. The methods can be used during manufacture or after use, in the field.

[0045] Any of the embodiments of this disclosure may be performed manually, with automation, or with a combination of manually and with automation. In some embodiments, the methods are automated. In some embodiments, the methods are automated with any suitable automation techniques known in the art that facilitate the success of the methods described herein. In some embodiments, the methods are automated with an automated

system.

[0046] Figure 11 shows a block diagram of an example automated system 200 for analyzing layer thickness of a multilayer component part 300. Automated system 200 may be used according to the methods of the present disclosure, including the methods shown in Figures 12-14.

[0047] Automated system 200 includes a processor 202, a controller 204, a power supply 206, a manipulator 208, and attachments 210.

[0048] The processor 202 may be any suitable processor known in the art that facilitates the success of the systems described herein. The processor 202 is configured to process image processing software. The processor 202 is also configured to calculate at least a thickness of the bond coat and/or a thickness of the depletion layer of an exposed plurality of material layers from an image and based on a predefined geometry of the opening.

[0049] The controller 204 may be any suitable controller known in the art that facilitates the success of the systems described herein. The controller 204 is in electronic communication with, and configured to control each of, the power supply 206, the processor 202, and the manipulator 208.

[0050] The power supply 206 may be any suitable controller known in the art that facilitates the success of the systems described herein.

[0051] The manipulator 208 may be any suitable manipulator known in the art that facilitates the success of the systems described herein. The manipulator 208 may be in the form of a robotic arm. The manipulator 208 may be mechanically and/or electronically coupled to one or more attachments 212 and/or one or more tools 400. The tools 400 are separate from the automated system 200 and the attachments 210 may be detachable from the automated system 200. The manipulator 208 is configured to interact with the multilayer component part 300, the attachments 210, and the tools 400.

[0052] The attachments 210 may be any suitable attachments known in the art that facilitate the success of the systems described herein. For example, the manipulator may have a drill device attachment for drilling, a polishing device attachment for polishing and preparation, and an imaging device attachment for imaging.

[0053] FIG. 12 shows a flow diagram of an example automated method 500 of analyzing layer thickness of a multilayer component part with an automated system comprising a

manipulator and a processor. The method includes receiving 502 at a manipulator of the automated system the multilayer component; creating 504 an opening with an opening forming device coupled to the manipulator, the opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component comprises a plurality of material layers including at least a substrate and a bond coat, and wherein the opening exposes each of the plurality of material layers; creating 506 with an imaging device coupled to the manipulator an image of the exposed plurality of material layers in the opening; and calculating 508 with the processor of the automated system at least a thickness of the bond coat of the exposed plurality of material layers from the image and based on the predefined geometry of the opening.

[0054] FIG. 13 shows a flow diagram of an example automated method 600 of repairing a multilayer component with an automated system comprising a manipulator and a processor. The method includes receiving 602 at a manipulator of the automated system the multilayer component; creating 604 an opening with an opening forming device coupled to the manipulator, the opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component comprises a plurality of material layers including at least a substrate and a bond coat, and wherein the opening exposes each of the plurality of material layers; creating 606 with an imaging device coupled to the manipulator an image of the exposed plurality of material layers in the opening; calculating 608 with the processor of the automated system at least a thickness of the bond coat of the exposed plurality of material layers from the image and based on the predefined geometry of the opening; and repairing 610 with the repairing device coupled to the manipulator of the automated system the opening.

[0055] FIG. 14 shows a flow diagram of an example automated method 700 of analyzing layer thickness of a multilayer component part. A multilayer component part is loaded 702 to an automated system. A manipulator drills 704 a hole on the multilayer component part. The manipulator uses 706 a polishing device to polish and prepare the hole surface. The manipulator uses 708 an imaging device to record an image of the hole. The image is provided 710 to machine vision software. The hole and coating layers are located 712 in the

image. Visual features for depletion and oxidation are located 714 with deep learning algorithms. The visual features are evaluated 716 for depletion and oxidation. Evaluation results are presented 718. This example automated method 700 is capable of rapid and cost-effective evaluation and/or repair.

5 [0056] The multilayer component part may be loaded 702 with any suitable loading technique known in the art that facilitate the success of the methods described herein. In some embodiments, the multilayer component part is received at the manipulator. In some
10 embodiments, the multilayer component part is provided to the manipulator. In some embodiments, the manipulator approaches one or more pre-defined points of the multilayer component part.

[0057] The manipulator may be any suitable loading manipulator known in the art that facilitates the success of the methods described herein. In some embodiments, the manipulator is a robotic manipulator. In some embodiments, the manipulator is fully automated. In some embodiments, the manipulator is partially automated.

15 [0058] The manipulator uses a variety of tools. The tools may be in the form of individual tools, devices including tools, and/or tool attachments. The tools may be integrated with the manipulator and/or readily available to the manipulator. For example, the manipulator may have a drill device attachment for drilling, a polishing device attachment for polishing and preparation, and an imaging device attachment for imaging. Each of these tools may be used
20 sequentially or simultaneously. Where the tools are not integrated with the manipulator, the manipulator may exchange one tool for another. The manipulator may exchange or switch tools at any point in the method.

[0059] The manipulator drills 704 a hole on the multilayer component part. In some embodiments, the manipulator machines a surface of the multilayer component part to
25 produce a hole having a required shape at a defined depth. The shape may be any shape, including circles, regular or irregular polygons, squares, rectangles, triangles, pentagons, hexagons, heptagons, or octagons. In some embodiments, the manipulator machines a surface of the multilayer component part to produce a hole at a predefined location. The predefined hole shape is deep enough to reach the base material and sized to show all layers of coating.

30 [0060] After drilling the hole, the manipulator uses 706 a polishing device to clear the machined surface and prepare it for inspection. The polishing devices removes debris from

the hole. The polishing device may also apply an etchant.

[0061] After the hole is prepared, the manipulator records 708 one or more images of the prepared surface. The one or more images may include a single still image in a picture format or a series of images in a video format. The one or more images may be recorded at the same
5 viewpoint or different viewpoints. The one or more images may be recorded at the same time or different times.

[0062] The one or more recorded images are provided 710 to image processing software (e.g., machine vision software) which analyzes the one or more images with an algorithm. The algorithm may be any suitable algorithm known in the art that facilitates the success of the
10 methods described herein. In some embodiments, the algorithm is an artificial intelligence algorithm, a machine learning algorithm, a deep learning algorithm, or a combination thereof.

[0063] The image processing software may perform any suitable analysis known in the art that facilitates the success of the methods described herein. In some embodiments, the image processing software analyzes the one or more images to locate 712 the hole and the coating
15 layers, to locate 714 visual features for depletion and oxidation, and/or to evaluate 716 depletion and oxidation.

[0064] After analysis, the image processing software generates and/or presents 718 a report that includes the analysis results. The report may be generated manually or by automation. In some embodiments, the report includes information relating evaluated depletion and/or
20 oxidation. In some embodiments, the report includes a determination of pass or fail for the multilayer component part. For example, if the multilayer component part exhibits depletion and/or oxidation exceeding a predefined standard, then the report may indicate a status of fail for that multilayer component part.

[0065] The foregoing drawings show some of the processing associated according to several
25 embodiments of this disclosure. In this regard, it should also be noted that in some alternative implementations, the acts noted may occur out of the order described or, for example, may in fact be executed substantially concurrently or in the reverse order, depending upon the act involved. Also, one of ordinary skill in the art will recognize that additional steps that describe the processing may be added.

[0066] The terminology used herein is for the purpose of describing particular embodiments
30 only and is not intended to be limiting of the disclosure. As used herein, the singular forms

“a”, “an” and “the” are intended to include the plural forms as well, unless the context clearly indicates otherwise. It will be further understood that the terms “comprises” and/or “comprising,” when used in this specification, specify the presence of stated features, integers, steps, operations, elements, and/or components, but do not preclude the presence or addition of one or more other features, integers, steps, operations, elements, components, and/or groups thereof. “Optional” or “optionally” means that the subsequently described event or circumstance may or may not occur, and that the description includes instances where the event occurs and instances where it does not.

[0067] Approximating language, as used herein throughout the specification and claims, may be applied to modify any quantitative representation that could permissibly vary without resulting in a change in the basic function to which it is related. Accordingly, a value modified by a term or terms, such as “about,” “approximately” and “substantially,” are not to be limited to the precise value specified. In at least some instances, the approximating language may correspond to the precision of an instrument for measuring the value. Here and throughout the specification and claims, range limitations may be combined and/or interchanged, such ranges are identified and include all the sub-ranges contained therein unless context or language indicates otherwise. “Approximately” as applied to a particular value of a range applies to both values, and unless otherwise dependent on the precision of the instrument measuring the value, may indicate +/- 10% of the stated value(s).

[0068] The corresponding structures, materials, acts, and equivalents of all means or step plus function elements in the claims below are intended to include any structure, material, or act for performing the function in combination with other claimed elements as specifically claimed. The description of the present disclosure has been presented for purposes of illustration and description, but is not intended to be exhaustive or limited to the disclosure in the form disclosed. Many modifications and variations will be apparent to those of ordinary skill in the art without departing from the scope and spirit of the disclosure. The embodiment was chosen and described in order to best explain the principles of the disclosure and the practical application, and to enable others of ordinary skill in the art to understand the disclosure for various embodiments with various modifications as are suited to the particular use contemplated.

[0069] Further aspects of the present disclosure are provided by the subject matter of the

following clauses:

[0070] 1. A method of analyzing layer thickness of a multilayer component, the method comprising:

- 5 creating an opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component includes a plurality of material layers including a substrate and a bond coat and the opening exposes each of the plurality of material layers including the substrate;
- creating an image of the exposed plurality of material layers in the opening using a digital microscope; and
- 10 calculating at least a thickness of the bond coat of the exposed plurality of material layers from the image and based on the predefined geometry of the opening.

[0071] 2. The method of any preceding clause, wherein the bond coat includes MrCrAlY , and the plurality of material layers further includes a depletion layer over the bond coat, and further comprising determining a thickness of the depletion layer.

- 15 [0072] 3. The method of any preceding clause, further comprising determining a life expectancy of the bond coat based on the at least one of the thickness of the depletion layer and the thickness of the bond coat.

[0073] 4. The method of any preceding clause, wherein the plurality of material layers further includes an oxide layer over the depletion layer.

- 20 [0074] 5. The method of any preceding clause, wherein the opening creating includes drilling to create a cone-shaped hole.

[0075] 6. The method of any preceding clause, further comprising increasing a contrast of the exposed plurality of material layers exclusively in the opening from that present after the opening creating.

- 25 [0076] 7. The method of any preceding clause, wherein the increasing contrast includes: polishing the exposed plurality of material layers; and etching the exposed plurality of material layers.

[0077] 8. The method of any preceding clause, wherein the polishing includes using a felt with a diamond paste, and the etching includes using an etchant.

- 30 [0078] 9. The method of any preceding clause, wherein the plurality of material layers includes an oxide layer over the bond coat and the bond coat over the substrate.

- [0079] 10. The method of any preceding clause, further comprising repairing the opening, allowing the multilayer component to be used for an intended purpose thereof.
- [0080] 11. The method of any preceding clause, wherein prior to the drilling, the multilayer component further includes a thermal barrier coating (TBC) layer over the oxide layer, and
5 further comprising removing at least a portion of the TBC layer prior to the drilling, and wherein the repairing includes repairing the at least a portion of the TBC layer.
- [0081] 12. The method of any preceding clause, wherein the method is performed prior to use of the multilayer component.
- [0082] 13. The method of any preceding clause, wherein prior to the drilling, the multilayer
10 component further includes a thermal barrier coating (TBC) layer over the bond coat, and further comprising removing at least a portion of the TBC layer prior to the drilling, and wherein the repairing includes repairing the at least a portion of the TBC layer.
- [0083] 14. The method of any preceding clause, wherein the method is performed at a geographic location of a use site of the multilayer component.
- 15 [0084] 15. The method of any preceding clause, wherein the repairing the opening includes using at least one handheld device.
- [0085] 16. A multilayer component, comprising:
a substrate;
a bond coat over the substrate;
20 a thermal barrier coating (TBC) layer over the bond coat, the TBC layer having a first outer surface indications of exposure to a hot gas path environment; and
a filled opening in the substrate, the bond coat and the TBC layer, the filled opening including:
a substrate repair fill filling the filled opening in the substrate,
25 a bond coat repair fill filling the filled opening in the bond coat, and
a thermal barrier coating (TBC) plug filling the filled opening in the TBC layer, the TBC plug having a second outer surface having no or less indications of exposure to the hot gas path environment than the first outer surface.
- [0086] 17. The multilayer component of any preceding clause, wherein the substrate repair
30 fill filling the filled opening in the substrate is the same material as the bond coat repair fill filling the filled opening in the bond coat.

[0087] 18. A method of analyzing layer thickness of a multilayer component, the method comprising:

drilling to create an opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component includes a plurality of material layers including a substrate, a bond coat over the substrate, and wherein the opening exposes each of the plurality of material layers;

increasing a contrast of the exposed plurality of material layers exclusively in the opening from that present after the opening creating by polishing the exposed plurality of material layers, and etching the exposed plurality of material layers;

10 creating an image of the exposed plurality of material layers in the opening using a digital microscope;

calculating a thickness of the bond coat from the image and based on the predefined geometry of the opening; and

15 repairing the opening, allowing the multilayer component to be used for an intended purpose thereof.

[0088] 19. The method of any preceding clause, wherein the method is performed at a geographic location of a field of use site of the multilayer component.

[0089] 20. The method of any preceding clause, wherein prior to the drilling, the multilayer component further includes a thermal barrier coating (TBC) layer over the oxide layer, and further comprising removing the TBC layer prior to the drilling, and wherein the repairing includes repairing the TBC layer.

[0090] 21. A system for analyzing layer thickness of a multilayer component, the system comprising:

25 an opening forming device configured to create an opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component comprises a plurality of material layers including at least a substrate and a bond coat and wherein the opening exposes each of the plurality of material layers; and

30 an imaging device configured to create an image of the exposed plurality of material layers in the opening;

wherein the system is configured to calculate at least a thickness of the bond coat of

the exposed plurality of material layers from the image and based on the predefined geometry of the opening.

[0091] 22. The system of any preceding clause, wherein the plurality of material layers further includes a depletion layer extending over the bond coat and the system is further
5 configured to determine a thickness of the depletion layer.

[0092] 23. The system of any preceding clause, wherein the system is further configured to determine a life expectancy of the bond coat based on the at least one of the thickness of the depletion layer and the thickness of the bond coat.

[0093] 24. The system of any preceding clause, further comprising a contrast increasing
10 device configured to increase a contrast of the exposed plurality of material layers in the opening.

[0094] 25. The system of any preceding clause, wherein the contrast increasing device is selected from the group consisting of a polisher, a felt with diamond paste, an etchant, an electrochemical etchant, and combinations thereof.

15 [0095] 26. The system of any preceding clause, further comprising a TBC layer removing device.

[0096] 27. The system of any preceding clause, wherein the TBC layer removing device is a grit or sand blaster.

[0097] 28. The system of any preceding clause, wherein the opening forming device is
20 selected from the group consisting of drilling devices, calotte grinding devices, material removal tools, milling tools, and combinations thereof.

[0098] 29. The system of any preceding clause, wherein the imaging device is a microscope.

[0099] 30. The system of any preceding clause, wherein the imaging device is handheld and portable.

25 [00100] 31. A system for repairing a multilayer component, the system comprising:

an opening forming device configured to create an opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component comprises a plurality of material layers including at least a substrate and a bond coat and wherein the opening exposes each of
30 the plurality of material layers;

an imaging device configured to create an image of the exposed plurality of material

layers in the opening; and

a repairing device configured to repair the opening;

wherein the system is configured to calculate at least a thickness of the bond coat of the exposed plurality of material layers from the image and based on the predefined geometry of the opening prior to the repair of the opening.

[00101] 32. The system of any preceding clause, further comprising a contrast increasing device configured to increase a contrast of the exposed plurality of material layers in the opening.

[00102] 33. The system of any preceding clause, wherein the contrast increasing device is selected from the group consisting of a polisher, a felt with diamond paste, an etchant, an electrochemical etchant, and combinations thereof.

[00103] 34. The system of any preceding clause, wherein the repairing device is a handheld device.

[00104] 35. The system of any preceding clause, wherein the repairing device is configured for high velocity oxygen fuel (HVOF) application, low pressure plasma spraying (LPPS), and/or atmospheric plasma spraying (APS).

[00105] 36. The system of any preceding clause, wherein the repairing device is selected from the group consisting of a laser wire welding device, a tungsten inert gas (TIG) welding device, a thermal spray process device, an atmospheric plasma spray (APS) device, a flame spraying device, a slurry coating device, and combinations thereof.

[00106] 37. The system of any preceding clause, wherein the repairing device is configured to receive a multilayer component that has been dismantled from a use setting.

[00107] 38. The system of any preceding clause, wherein the use setting is inside a turbine.

[00108] 39. The system of any preceding clause, wherein the multilayer component is used in an airfoil.

[00109] 40. The system of any preceding clause, wherein the multilayer component is used in a turbine blade.

[00110] 41. An automated system for analyzing layer thickness of a multilayer component, the automated system comprising:

a manipulator coupled to:

an opening forming device configured to create an opening having a

predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component comprises a plurality of material layers including at least a substrate and a bond coat, and wherein the opening exposes each of the plurality of material layers; and

5 an imaging device configured to create an image of the exposed plurality of material layers in the opening; and

 a processor configured to calculate at least a thickness of the bond coat of the exposed plurality of material layers from the image and based on the predefined geometry of the opening.

10 [00111] 42. The automated system of any preceding clause, wherein the plurality of material layers further includes a depletion layer extending over the bond coat and the processor is further configured to determine a thickness of the depletion layer.

 [00112] 43. The automated system of any preceding clause, wherein the processor is further configured to determine a life expectancy of the bond coat based on the at least one of the
15 thickness of the depletion layer and the thickness of the bond coat.

 [00113] 44. The automated system of any preceding clause, wherein at least one of the opening forming device and the imaging device are coupled to the manipulator in the form of attachments attached to the manipulator.

 [00114] 45. The automated system of any preceding clause, wherein at least one of the
20 opening forming device and the imaging device are coupled to the manipulator in the form of tools separate from the manipulator.

 [00115] 46. The automated system of any preceding clause, wherein the manipulator is further coupled to at least one of a contrast increasing device configured to increase a contrast of the exposed plurality of material layers in the opening, a repairing device configured to
25 repair the opening, and a TBC layer removing device.

 [00116] 47. The automated system of any preceding clause, wherein at least one of the contrast increasing device, the repairing device, and the TBC layer removing device are coupled to the manipulator in the form of attachments attached to the manipulator.

 [00117] 48. The automated system of any preceding clause, wherein at least one of the
30 contrast increasing device, the repairing device, and the TBC layer removing device are coupled to the manipulator in the form of tools separate from the manipulator.

- [00118] 49. The automated system of any preceding clause, further comprising a controller and/or a power supply.
- [00119] 50. The automated system of any preceding clause, wherein the manipulator is configured to receive a multilayer component that has been dismounted from a use setting.
- 5 [00120] 51. The automated system of any preceding clause, wherein the use setting is inside a turbine.
- [00121] 52. The automated system of any preceding clause, wherein the multilayer component is used in an airfoil.
- [00122] 53. The automated system of any preceding clause, wherein the multilayer component is used in a turbine blade.
- 10 [00123] 54. A method of analyzing layer thickness of a multilayer component with an automated system comprising a manipulator and a processor, the method comprising:
- receiving at the manipulator of the automated system the multilayer component;
- creating an opening with an opening forming device coupled to the manipulator, the opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component comprises a plurality of material layers including at least a substrate and a bond coat, and wherein the opening exposes each of the plurality of material layers;
- 15 [00124] 55. The method of any preceding clause, wherein the plurality of material layers further comprises determining a thickness of the depletion layer.
- creating with an imaging device coupled to the manipulator an image of the exposed plurality of material layers in the opening; and
- 20 [00125] 56. The method of any preceding clause, further comprising determining a life expectancy of the bond coat based on the at least one of the thickness of the depletion layer and the thickness of the bond coat.
- calculating with the processor of the automated system at least a thickness of the bond coat of the exposed plurality of material layers from the image and based on the predefined geometry of the opening.
- 30 [00126] 57. A method of repairing a multilayer component with an automated system comprising a manipulator and a processor, the method comprising:

- receiving at the manipulator of the automated system the multilayer component;
creating an opening with an opening forming device coupled to the manipulator, the opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component
- 5 comprises a plurality of material layers including at least a substrate and a bond coat, and wherein the opening exposes each of the plurality of material layers;
- creating with an imaging device coupled to the manipulator an image of the exposed plurality of material layers in the opening;
- calculating with the processor of the automated system at least a thickness of the bond
- 10 coat of the exposed plurality of material layers from the image and based on the predefined geometry of the opening; and
- repairing with the repairing device coupled to the manipulator of the automated system the opening.
- [00127] 58. The method of any preceding clause, wherein the plurality of material layers
- 15 further includes a depletion layer extending over the bond coat, and wherein the method further comprises determining a thickness of the depletion layer.
- [00128] 59. The method of any preceding clause, further comprising determining a life expectancy of the bond coat based on the at least one of the thickness of the depletion layer and the thickness of the bond coat.
- 20 [00129] 60. The method of any preceding clause, wherein prior to the creating an opening, the multilayer component further includes a thermal barrier coating (TBC) layer extending over the oxide layer, wherein the method further comprises removing the TBC layer prior to the creating an opening, and wherein the repairing includes repairing the TBC layer.

CLAIMS

What is claimed is:

1. An automated system for analyzing layer thickness of a multilayer component, the automated system comprising:
 - 5 a manipulator coupled to:
 - an opening forming device configured to create an opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component comprises a plurality of material layers including at least a substrate and a bond coat, and wherein the opening
 - 10 exposes each of the plurality of material layers; and
 - an imaging device configured to create an image of the exposed plurality of material layers in the opening; and
 - a processor configured to calculate at least a thickness of the bond coat of the exposed plurality of material layers from the image and based on the predefined geometry of the
 - 15 opening.
2. The automated system of claim 1, wherein the plurality of material layers further includes a depletion layer extending over the bond coat and the processor is further configured to determine a thickness of the depletion layer.
- 20 3. The automated system of claim 2, wherein the processor is further configured to determine a life expectancy of the bond coat based on the at least one of the thickness of the depletion layer and the thickness of the bond coat.
- 25 4. The automated system of claim 1, wherein at least one of the opening forming device and the imaging device are coupled to the manipulator in the form of attachments attached to the manipulator.
- 30 5. The automated system of claim 1, wherein at least one of the opening forming device and the imaging device are coupled to the manipulator in the form of tools separate from the manipulator.

6. The automated system of claim 1, wherein the manipulator is further coupled to at least one of a contrast increasing device configured to increase a contrast of the exposed plurality of material layers in the opening, a repairing device configured to repair the opening,
5 and a TBC layer removing device.
7. The automated system of claim 6, wherein at least one of the contrast increasing device, the repairing device, and the TBC layer removing device are coupled to the manipulator in the form of attachments attached to the manipulator.
- 10 8. The automated system of claim 6, wherein at least one of the contrast increasing device, the repairing device, and the TBC layer removing device are coupled to the manipulator in the form of tools separate from the manipulator.
- 15 9. The automated system of claim 1, further comprising a controller and/or a power supply.
10. The automated system of claim 1, wherein the manipulator is configured to receive a multilayer component that has been dismounted from a use setting.
- 20 11. The automated system of claim 10, wherein the use setting is inside a turbine.
12. The automated system of claim 10, wherein the multilayer component is used in an airfoil.
- 25 13. The automated system of claim 10, wherein the multilayer component is used in a turbine blade.
14. A method of analyzing layer thickness of a multilayer component with an automated
30 system comprising a manipulator and a processor, the method comprising:
receiving at the manipulator of the automated system the multilayer component;
creating an opening with an opening forming device coupled to the manipulator, the opening having a predefined geometry partially into the multilayer component at a selected

location on a surface of the multilayer component, wherein the multilayer component comprises a plurality of material layers including at least a substrate and a bond coat, and wherein the opening exposes each of the plurality of material layers;

5 creating with an imaging device coupled to the manipulator an image of the exposed plurality of material layers in the opening; and

 calculating with the processor of the automated system at least a thickness of the bond coat of the exposed plurality of material layers from the image and based on the predefined geometry of the opening.

10 15. The method of claim 14, wherein the plurality of material layers further includes a depletion layer extending over the bond coat, and wherein the method further comprises determining a thickness of the depletion layer.

 16. The method of claim 15, further comprising determining a life expectancy of the bond
15 coat based on the at least one of the thickness of the depletion layer and the thickness of the bond coat.

 17. A method of repairing a multilayer component with an automated system comprising a manipulator and a processor, the method comprising:

20 receiving at the manipulator of the automated system the multilayer component;

 creating an opening with an opening forming device coupled to the manipulator, the opening having a predefined geometry partially into the multilayer component at a selected location on a surface of the multilayer component, wherein the multilayer component comprises a plurality of material layers including at least a substrate and a bond coat, and
25 wherein the opening exposes each of the plurality of material layers;

 creating with an imaging device coupled to the manipulator an image of the exposed plurality of material layers in the opening;

 calculating with the processor of the automated system at least a thickness of the bond coat of the exposed plurality of material layers from the image and based on the predefined
30 geometry of the opening; and

 repairing with the repairing device coupled to the manipulator of the automated

system the opening.

18. The method of claim 17, wherein the plurality of material layers further includes a depletion layer extending over the bond coat, and wherein the method further comprises
5 determining a thickness of the depletion layer.

19. The method of claim 18, further comprising determining a life expectancy of the bond coat based on the at least one of the thickness of the depletion layer and the thickness of the bond coat.

10

20. The method of claim 17, wherein prior to the creating an opening, the multilayer component further includes a thermal barrier coating (TBC) layer extending over the oxide layer, wherein the method further comprises removing the TBC layer prior to the creating an opening, and wherein the repairing includes repairing the TBC layer.

15
