

MOVABLE STRUCTURE

ABSTRACT

A movable structure 1 comprises: a structure body 2 floatable on a water surface WS; a fan 6 provided on the structure body 2 and capable of generating an airstream directed outwardly from the structure body 2 in a width direction of the structure body 2; and a guide surface 72a provided on the structure body 2 and configured to guide the airstream generated by the fan 6. The guide surface 72a is disposed at a position offset from a center point CP of the structure body 2 in the width direction, and configured to change a traveling direction of the airstream generated by the fan 6 to increase an upward directivity of the airstream.
