

Method And System For In-store Wireless Mobile Payment

ABSTRACT

5

A method and system for in-store wireless mobile payment are provided. The method provides for accessing a secure wireless network used by an in-store system so as to make payment for goods or services over the secure wireless network. The method comprises initializing an application installed in a device capable of making the payment of goods or services, wherein the application is configured to generate a handshaking signal that is recognized by the in-store system to allow the device to access the secure wireless network established by the in-store system; transmitting the handshaking signal from the device to the in-store system; establishing access to the secure wireless network in response to validation of the handshaking signal by the in-store system; and initiating a payment process used to complete the payment for the goods or services.
