

ABSTRACT

A display method and apparatus for an interactive interface, and a storage medium and an electronic apparatus. The method comprises: displaying, in a front display area of a display screen of a mobile terminal, a first interactive interface used by a target game; detecting a first interactive operation in a back display area; and switching, in response to the first interactive operation, the first interactive interface displayed in the front display area to a second interactive interface, wherein the second interactive interface has an interactive object different from an interactive object in the first interactive interface. In the present invention, an interactive operation of a front display area and that of a back display area can be detected simultaneously, thereby realizing the function of performing multiple operations by means of multiple touch screens.
