FLOWING LIQUID TYPE CLEANING APPARATUS

ABSTRACT

A flowing liquid type cleaning apparatus features a drain plate fitted with many drain pipes opening to a cleaning tank portion, the drain pipes having flow rate regulators respectively. Cleaning liquid containing contaminants is continuously exhausted from the cleaning tank portion through the drain pipes and flow rate distribution of cleaning liquid in the cleaning tank portion is adjusted by the regulators. As cleaning liquid is exhausted without falling down over the upper edge of a drain plate like as a prior art, exhausted liquid is not foamed. Thus contaminants contained in exhausted liquid are prevented from returning to the cleaning tank portion over the drain plate by assuming the form of foam.
