

DESCRIPTION

PARTIALLY SATURATED NITROGEN-CONTAINING
HETEROCYCLIC COMPOUND

TECHNICAL FIELD

[0001] The present invention relates to novel prolyl hydroxylase (hereinafter also referred to as PHD) inhibitors, in particular, prolyl hydroxylase 2 (hereinafter also referred to as PHD2) inhibitors.

BACKGROUND ART

[0002] Erythrocytes in the blood are responsible for oxygen transport throughout the body and play an important role in maintaining oxygen levels constant in vivo. If, on account of bleeding due to certain kinds of disease, as well as to accidents or surgical operations, the erythrocyte counts or hemoglobins level in the blood decrease, a sense of fatigue, dizziness, shortness of breath and other anemic symptoms will develop. In anemia, the entire body will be exposed to oxygen deficiency and under such hypoxic conditions, the living body performs a compensatory reaction, in which the hematopoietic factor erythropoietin (hereinafter also referred to as EPO) which promotes the formation of erythrocytes is produced primarily from the kidney to increase the erythrocyte and hemoglobin levels in the blood, thus helping to ameliorate anemia. However, in certain kinds of disease, this erythropoietic action of erythropoietin is impaired and chronic anemia persists. For example, in patients with renal failure who have disorder in the kidney, it is known that the above-described mechanism for erythropoietin production under hypoxic conditions fails to work properly, causing them to present with a type of anemia (renal anemia) which is characterized by reduced erythrocyte counts and hemoglobin levels (see Non-Patent Documents 1 and 2).

[0003] The treatment of renal anemia and the anemia that accompanies cancer chemotherapy or medication of patients with HIV infection is currently carried out by erythropoiesis stimulating agents (ESA) such as genetically recombinant human

erythropoietin preparations. The ESA greatly contributes to improving a patient's quality of life by increasing the erythrocyte counts and hemoglobin levels sufficiently to ameliorate the symptoms that accompany anemia. On the other hand, however, the currently available ESAs are all biologics in the form of expensive injections, so it is desired to develop an orally administrable pharmaceutical drug for the treatment of anemia.

[0004] A recent study has reported that erythropoietin also has an action for protecting tissues such as hearts and brains placed under the hypoxic conditions that accompany anemia. Therefore, orally administrable ESA preparations have the potential to find a wide range of applications covering not only renal and other types of anemia that result from various causes but also a diversity of ischemic diseases (see Non-Patent Document 3).

[0005] A substance that may be mentioned as a factor that increases the production of erythropoietin is a hypoxia-inducible factor (hereinafter also referred to as HIF). The HIF is a transcription factor including an α -subunit the degradation of which is regulated by changes in oxygen density and a β -subunit that is expressed constantly. Prolyl hydroxylases (PHD-1, -2 and -3) are known as factors that regulate the degradation of HIF's α -subunit (HIF- α). Under normal oxygen pressure conditions, the proline residues of HIF- α are hydroxylated by these prolyl hydroxylases and the HIF- α is rapidly degraded by proteasome. Under hypoxic conditions, on the other hand, the activity of prolyl hydroxylases is lowered, so the degradation of HIF- α is suppressed, thus promoting the transcription of the erythropoietin- and other HIF-responsive genes. Consequently, by inhibiting the prolyl hydroxylases, the stabilization of HIF- α is promoted, making it possible to increase the production of erythropoietin (see Non-Patent Documents 1, 2 and 4).

[0006] The compounds of the present invention provide means for inhibiting the activities of those prolyl hydroxylases to increase the amount of erythropoietin, thereby treating anemia. As another benefit, not only anemia but also various other ischemic diseases (e.g. brain stroke, myocardial infarction, and ischemic renal disorder) and diabetic complications (nephropathy, retinopathy, and neuropathy) can also be treated or prevented or improved or mitigated in symptoms by administering the compounds of the present invention (see Non-

Patent Document 5).

[0007] Common PHD inhibitors reported to date include 4-hydroxyisoquinoline derivatives (see Patent Document 1), 5-hydroxy-3-oxo-2,3-dihydro-1H-pyrazole derivatives (see Patent Document 2), 4-hydroxy-2-oxo-1,2-dihydroquinoline derivatives (see Patent Document 3), 3-hydroxypyridine derivatives (see Patent Document 4), 2-oxo-2,3-dihydroindole derivatives (see Patent Document 5), etc. but compounds having the structures according to the present invention have not been disclosed. Also reported to date include are 6-hydroxy-2,4-dioxo-1,2,3,4-tetrahydropyrimidine derivatives (see Patent Document 6), 4-hydroxy-6-oxo-1,6-dihydropyrimidine derivatives (see Patent Document 7), 5-hydroxy-3-oxo-2,3-dihydropyridazine derivatives (see Patent Document 8), 6-hydroxy-4-oxo-4H-1,3-dioxin derivatives (see Patent Document 9), 4-hydroxy-2-oxo-1,2,5,7-tetrahydrofluoro[3,4-b]pyridine derivatives (see Patent Document 10), 4-hydroxy-2-oxo-1,2-dihydropyridine derivatives (see Patent Documents 11 and 12), etc. but compounds having the structures according to the present invention have not been disclosed.

A saturated aqueous solution of ammonium chloride was

added to the reaction mixture, which was then extracted with ethyl acetate three times. The combined organic layers were washed with saturated brine and dried over anhydrous magnesium sulfate. The desiccant was removed by filtration and the filtrate was concentrated under reduced pressure. 6-(4-Cyclopropylphenoxy)pyridine-3-carbaldehyde

[0230] [Formula 55]

(1) Synthesis of 6-(4-bromophenoxy)pyridine-3-carbaldehyde

[0231]

[Formula 56]

To a solution of 4-bromophenol (2.79 g) in N,N-dimethylformamide (25.0 mL), potassium carbonate (2.45 g) was added and the mixture was stirred at room temperature for 10 minutes. Subsequently, 6-bromo-3-pyridinecarboxyaldehyde (3.00 g) was added and the mixture was stirred at 130°C for 2.5 hours. After cooling the reaction mixture to room temperature, water was added to it and extraction was conducted with ethyl acetate. The combined organic layers were washed with water and saturated brine successively and after passage through a phase separator, they were concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (n-hexane:ethyl acetate = 100:0-50:50) to give 6-(4-bromophenoxy)pyridine-3-carbaldehyde as a pale yellow solid (3.23 g).

¹H NMR (300 MHz, CHLOROFORM-d) δ ppm 7.01 - 7.13 (m, 3 H) 7.51 - 7.61 (m, 2 H) 8.21 (dd, J=8.6, 2.4 Hz, 1 H) 8.61 (dd, J=2.4, 0.7 Hz, 1 H) 9.99 (d, J=0.7 Hz, 1 H).

MS ESI/APCI Dual posi: 278[M+H]⁺.

(2) Synthesis of the titled compound

A mixture of the compound (3.22 g) obtained in step (1) above, 2-cyclopropyl-4,4,5,5-tetramethyl-1,3,2-dioxaborolane (3.89 g), tetrakis(triphenylphosphine)palladium(0) (669 mg), cesium carbonate (11.3 g), toluene (20.0 mL) and water (10.0 mL) was stirred at 100°C for 6 hours. After cooling the reaction mixture to room temperature, the precipitate was removed by filtration through Celite (registered trademark). To the filtrate, water and ethyl acetate were added and extraction was conducted with ethyl acetate. The combined organic layers were washed with water and saturated brine successively and after passage through a phase separator, they were concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (n-hexane:ethyl acetate = 100:0-50:50) and further purified by preparative HPLC. A saturated aqueous solution of sodium hydrogencarbonate was then added and extraction was conducted with ethyl acetate. The

combined organic layers were passed through a phase separator and thereafter concentrated under reduced pressure to give the titled compound as a colorless oil (614 mg).

^1H NMR (300 MHz, CHLOROFORM- d) δ ppm 0.65 - 0.76 (m, 2 H) 0.92 - 1.04 (m, 2 H) 1.84 - 1.98 (m, 1 H) 6.94 - 7.10 (m, 3 H) 7.11 - 7.20 (m, 2 H) 8.17 (dd, $J=8.6, 2.4$ Hz, 1 H) 8.60 - 8.67 (m, 1 H) 9.97 (d, $J=0.6$ Hz, 1 H).

[0232] [Formula 57]

To a solution of 4-hydroxybenzaldehyde (5.00 g) in N,N -dimethylacetamide (60.0 L), potassium carbonate (6.23 g) was added and the mixture was stirred at room temperature for 10 minutes. Subsequently, 2,5-difluoropyridine (4.71 g) was added and the mixture was stirred at 150°C for 64 hours. After cooling the reaction mixture to room temperature, water was added to it and extraction was conducted with ethyl acetate. The combined organic layers were washed with water and saturated brine successively and after passage through a phase separator, they were concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (n -hexane:ethyl acetate = 100:0-70:30) to give the titled compound as a colorless solid (3.24 g).

Reference Example A-486

Ethyl N-[1-(4-chlorophenyl)-2-propanyl]-β-alaninate

[0442]

[Formula 181]

To a solution of β -alanine ethyl ester hydrochloride (1.00 g) in ethanol (13.5 mL), triethylamine (907 μ L), 4-chlorophenylacetone (1.32 g), acetic acid (1.5 mL) and borane-2-picoline complex (1.39 g) were added successively and the mixture was stirred at 60°C for 30 minutes. After being cooled to room temperature, the mixture was concentrated under reduced pressure. To the resulting residue, a saturated aqueous solution of sodium hydrogencarbonate was added and the mixture was extracted with chloroform twice. The combined organic layers were washed with saturated brine and dried over anhydrous sodium sulfate. The desiccant was removed by filtration and the filtrate was concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (chloroform:methanol = 100:0-95:5) to give the titled compound as a yellow oil (1.70 g). ^1H NMR (300 MHz, CHLOROFORM- d) δ ppm 1.03 (d, J =6.2 Hz, 3 H) 1.22 (t, J =7.1 Hz, 3 H) 2.40 - 2.49 (m, 2 H) 2.51 - 2.61 (m, 1 H) 2.65 - 2.76 (m, 1 H) 2.79 - 2.99 (m, 3 H) 4.10 (q, J =7.1 Hz, 2 H) 7.06 - 7.15 (m, 2 H) 7.21 - 7.29 (m, 2 H).

MS ESI/APCI Dual posi: 270[M+H] $^+$.

Reference Example B-1

Ethyl N-{2-[4-(trifluoromethyl)phenyl]propan-2-yl}- β -alaninate

[0443] [Formula 182]

To a mixture of the compound (1.11 g) obtained in Reference Example 27-3, methanol (6.00 mL) and water (3.00 mL), ethyl acrylate (0.594 mL) was added and the resulting mixture was stirred at 90°C for an hour under irradiation with microwaves. After being cooled to room temperature, the reaction mixture was poured into water and extracted with ethyl acetate three times. The combined organic layers were washed with saturated brine and thereafter passed through a phase separator for concentrating under reduced

pressure. The resulting residue was purified by silica gel column chromatography (n-hexane:ethyl acetate = 95:5-10:90) to give the titled compound as a pale yellow oil (957 mg).

^1H NMR (300 MHz, CHLOROFORM- d) δ ppm 1.26 (t, $J=7.1$ Hz, 3 H) 1.47 (s, 6 H) 2.39 - 2.49 (m, 2 H) 2.53 - 2.61 (m, 2 H) 4.14 (q, $J=7.1$ Hz, 2 H) 7.58 (s, 4 H).

[0572] [Formula 226]

Indium(III) chloride (768 mg) was dried under reduced pressure while it was heated with a thermal gun. After being left to cool to room temperature, the reaction system was internally purged with argon. To the reaction system, dehydrated tetrahydrofuran (20.0 mL) was added and with stirring at -80°C, cyclopentyl magnesium bromide (2.0 mol/L, solution in diethyl ether, 5.23 mL) was added dropwise. After being stirred at that temperature for 30 minutes, the reaction mixture was brought to room temperature and stirred for 45 minutes. The compound (1.50 g) obtained in Example 2-1(1) and bis(tri-tert-butylphosphine)palladium(0) (788 mg) were added and the mixture was stirred at an external temperature of 75°C for two hours. After standing to cool to room temperature, methanol (5.00 mL) was added and the mixture was stirred for 30 minutes. After concentrating under reduced pressure, chloroform (30.0 mL) was added and the insoluble matter was removed by passage through Celite (registered trademark). The filtrate was concentrated under reduced pressure. The resulting residue was purified by preparative HPLC and further purified twice by silica gel column chromatography (chloroform:ethyl acetate = 100:0-85:15) to give tert-butyl N-{{1-(4-cyclopentylbenzyl)-4-hydroxy-2-oxo-1,2,5,6-tetrahydropyridin-3-

Example 7-1

N-{{[9-Benzoyl-1-(4-biphenyl)methyl]-4-hydroxy-2-oxo-1,9-diazaspiro[5.5]undec-3-en-3-yl}carbonyl}glycine

[0591]

[Formula 240]

(1) Synthesis of 2-methyl-2-propanyl 4-[(4-biphenylmethyl)(3-ethoxy-3-oxopropanoyl)amino]-4-(2-methoxy-2-oxoethyl)-1-piperidinecarboxylate

[0592] [Formula 241]

To a solution of the compound of Reference Example A-344 (3.14 g) and triethylamine (1.50 mL) in ethyl acetate (100 mL), ethyl malonyl chloride (1.22 mL) was added at 0°C and thereafter the mixture was stirred at room temperature for 30 minutes. The insoluble matter was removed by filtration and the filtrate was concentrated under reduced pressure. The resulting residue was purified by silica gel column chromatography (n-hexane:ethyl acetate = 90:10-50:50) to give 2-methyl-2-propanyl 4-[(4-biphenylmethyl)(3-ethoxy-3-oxopropanoyl)amino]-4-(2-methoxy-2-oxoethyl)-1-piperidinecarboxylate as a colorless amorphous mass (3.36 g).

(2) Synthesis of 3-ethyl 9-(2-methyl-2-propanyl) 1-(4-biphenylmethyl)-4-hydroxy-2-oxo-1,9-diazaspiro[5.5]undec-3-ene-3,9-dicarboxylate

[0593] [Formula 242]

To a solution in tetrahydrofuran (70 mL) of the mixture (3.35 g) obtained in step (1) above, sodium ethoxide (about 20%, solution in ethanol, 2.5 mL) was added and the mixture was stirred with heating under reflux for 4 hours. After cooling to room temperature, 2 mol/L hydrochloric acid was added and extraction was conducted with ethyl acetate. The combined organic layers were dried over anhydrous magnesium sulfate. [0624] The PHD2 inhibitory activities of compounds of the present invention were determined in accordance with Tests 1 and 2 described below.

Test 1

[0625] (1) Expression and preparation of human PHD2

Human PHD2 was expressed in insect cells (HighFive cells). A registered sequence of human PHD2 (NM_022051) was introduced into the pFastBac1 vector (Invitrogen), and the sequence was verified. The vector was introduced into Sf9 insect cells

(Invitrogen) to acquire human PHD2 baculovirus. HighFive insect cells (Invitrogen) were infected with this recombinant virus and cultured at 27°C for 72 hours; thereafter, a cell lysis solution containing various protease inhibitors was added and the cells were disrupted to form a suspension. The suspension of disrupted cells was centrifuged at 4°C and 100,000 ×g for 30 minutes and the supernatant was recovered as a cell lysate. Analysis by Western blotting confirmed that the human PHD2 protein was expressed only in the lysate of cells infected with the PHD2 baculovirus.

(2) Measurement of human PHD2 inhibitory activity

The activity of human PHD2 enzyme was measured with a substrate which is a 19-residue partial peptide based on the sequence of HIF-1 α . Specifically, the conversion of 2-oxoglutarate to succinic acid which would occur simultaneously with the hydroxylation of a proline residue in the peptide with the PHD2 enzyme was utilized. To be more specific, [^{14}C]-2-oxoglutarate was added to the reaction system to initiate an enzymatic reaction and the [^{14}C]-2-oxoglutarate remaining after the reaction was bound to 2,4-dinitrophenylhydrazine (DNPH), with the resulting precipitate being removed by passage through a filter. Subsequently, radiation counting was conducted on the resulting [^{14}C]-succinic acid.

The enzyme and the substrate were each diluted with a 20 mM tris-hydrochloric acid buffer (pH 7.5) containing 6.67 mM KCl, 2 mM MgCl₂, 13.3 μM iron sulfate, 2.67 mM ascorbic acid, and 1.33 mM DTT, whereas each test compound was diluted with dimethyl sulfoxide (DMSO).

A test compound, HIF-1 α peptide and [^{14}C]-2-oxoglutarate were preliminarily added onto 96-well plates and reaction was initiated by adding a human PHD2 enzyme solution (4 μg /well). After 15-min incubation at 37°C, a DNPH-containing quench solution was added and the mixture was allowed to stand at room temperature for 30 minutes. Thereafter, an excess of non-radiolabelled 2-oxoglutarate was added and the mixture was allowed to stand at room temperature for 60 minutes. The resulting precipitate was removed by passage through a filter and the radiation count on the [^{14}C]-succinic acid was

quantified (with MicroBeta). Radiation counting was conducted for each well and the human PHD2 inhibitory activity of each test compound was calculated on the basis of the values for the substrate-free group and the test compound-free group.

Test 2

(1) Expression and preparation of human PHD2

Human PHD2 was expressed in human cells (293FT cells). A registered sequence of human PHD2 (NM_022051) was introduced into pcDNA3.1/Hygro(+) vector (Invitrogen), and the sequence was verified. The vector was introduced into 293FT cells (Invitrogen) which were cultured at 37°C in the presence of 5% CO₂ gas for 48 hours; thereafter, a cell lysis solution containing various protease inhibitors was added and the cells were disrupted to form a suspension. The suspension of disrupted cells was centrifuged at 4°C and 100,000 ×g for 30 minutes and the supernatant was recovered as a cell lysate. Analysis by Western blotting confirmed that the human PHD2 protein was expressed in the cell lysate.

[0630] (2) Measurement of human PHD2 inhibitory activity

The activity of human PHD2 enzyme was measured with a substrate which is a 19-residue partial peptide based on the sequence of HIF-1 α ; specifically, the hydroxylation of a proline residue in the peptide was measured by FP (Fluorescence Polarization).

The enzyme and the substrate were each diluted with a 50 mM tris-hydrochloric acid buffer (pH 7.5) containing 12.5 mM KCl, 3.75 mM MgCl₂, 25 μ M iron sulfate, 5 mM ascorbic acid, and 2.5 mM DTT, whereas each test compound was diluted with dimethyl sulfoxide (DMSO).

A test compound and the substrate solution were preliminarily added onto 384-well plates and reaction was initiated by adding a human PHD2 enzyme solution (40 ng/well).

After 20-min incubation at 30°C, an EDTA-containing quench solution was added and the amount of the proline residues hydroxylated via binding to an added HIF-OH antibody solution was quantified by fluorescence polarization.

The fluorescence polarization of each well was measured and the human PHD2 inhibitory activity of each test compound was calculated on the basis of the values for the test compound-free group.

[0631] (3) Results

The inhibition data of human PHD2 for the test compounds (% inhibition, test compound's concentration was 1 μ M) are shown in the following Tables 27-1 to 27-4. For representative compounds, their IC₅₀ values (nM) are shown in the following Table 28-1.
