

DOUGH PROCESSING MACHINEABSTRACT

The invention concerns a special processing machine for dough,  
5 comprising - a cutting conveyor (3), a cutting blade (5) for cutting  
in a cutting direction (6), the blade (5) and/or the cutting conveyor  
being further driven in translation for separation purposes such that  
the blade (5) moves in translation relative to and along the cutting  
band while remaining substantially in contact with the latter,  
10 characterised by - a receiving conveyor (7) comprising a longitudinal  
receiving band (8), and in which the cutting conveyor (3) driven by  
the blade (5) is movable between an entry position and a transfer  
position, the blade and/or the cutting conveyor (3) further being  
driven in translation for transfer purposes such that the blade (5)  
15 then comes into contact with the receiving band (8).
