DERIVATIVES AND RELATED COMPOUNDS AS INHIBITORS OF THE ORTHOMYXOVIRUS REPLICATION

CROSS-REFERENCE TO RELATED APPLICATION

[001] This application claims the benefit of priority to U.S. Provisional Application No. 62/636378, filed 28 February 2018, the content of which is incorporated herein by reference.

FIELD OF THE INVENTION

[002] The invention provides compounds that inhibit orthomyxovirus replication and prodrugs thereof, and are accordingly useful for treatment of viral infections caused by orthomyxoviruses. The invention further provides pharmaceutical compositions containing these compounds and methods of using these compounds to treat or prevent viral infections caused by orthomyxovirus.

BACKGROUND

[003] Orthomyxoviruses have negative-sense single stranded RNA genomes, and replicate in the nucleus of infected cells, as they lack the machinery to generate the cap structure to produce their own mRNA. Members of the Orthomyxovirus family have an RNA-dependent RNA polymerase with endonuclease activity that cleaves a section of the capped 5'-end of cellular mRNA; the RNA polymerase then uses the cleavage product as a primer for synthesis of viral mRNA. This process is known as cap-snatching. This endonuclease has been recognized as a promising target for development of antivirals effective against orthomyxoviruses. *ACS Med. Chem. Letters*, 2014, vol. 5, 61-64. Inhibitors of this endonuclease have been disclosed, for example, in WO2015/038660, US Patent No. 8,987,441, WO2010/147068, and U.S. patent applications US2012/022251, US2013/0197219, US2014/256937, and US2015/0072982, which report that such inhibitors are useful to treat influenza infections in mammals.

[004] The orthomyxovirus family includes influenza A, influenza B and influenza C, all of which can infect humans, as well as several other genera of viruses that generally do not infect humans. Influenza A is the most virulent of these pathogens in humans, often accounting for the majority of serious cases of influenza during a typical flu season. It is estimated that influenza kills as many as 40,000 people per year in the U.S., in spite of the widespread use of vaccines to reduce the incidence of influenza; thus there is a great need for antiviral

therapeutics effective to treat influenza, especially influenza A. The present invention provides compounds that inhibit replication of orthomyxoviruses, including influenza A, influenza B and influenza C. Without being bound by theory, it is believed these compounds achieve their antiviral effects by inhibiting the endonuclease function of the viral polymerase. Because this endonuclease is highly conserved across influenza A viruses (id.), the compounds are especially useful for treatment of influenza A.

Unless otherwise specified, suitable substituents are selected from the substituents listed above for alkyl groups, except that hydroxyl and amino are not normally present on the carbon that is directly attached to the oxygen of the substituted ‘alkyl-O’ group.

[0019] Similarly, each alkyl part of other groups like “alkylaminocarbonyl”, “alkoxyalkyl”, “alkoxycarbonyl”, “alkoxy-carbonylalkyl”, “alkylsulfonyl”, “alkylsulfoxyl”, “alkylamino”, “haloalkyl”

shall have the same meaning as described in the above-mentioned definition of "alkyl". When used in this way, unless otherwise indicated, the alkyl group is often a 1-4 carbon alkyl and is not further substituted by groups other than the component named. When such alkyl groups are substituted, suitable substituents are those named above for alkyl groups unless, otherwise specified.

[0020] As used herein, the term "haloalkoxy" refers to haloalkyl-O-, wherein haloalkyl is defined above. Representative examples of haloalkoxy include, but are not limited to, fluoromethoxy, difluoromethoxy, trifluoromethoxy, trichloromethoxy, 2-chloroethoxy, 2,2,2-trifluoroethoxy, 1,1,1,3,3,3-hexafluoro-2-propoxy, and the like. Preferably, cycloalkyl groups are saturated monocyclic rings having 3-7 ring atoms, such as cyclopropyl, cyclobutyl, cyclopentyl and cyclohexyl, unless otherwise specified.

[0022] A substituted cycloalkyl is a cycloalkyl group substituted by one, or two, or three, or more than three substituents, up to the number of hydrogens on the unsubstituted group. Typically, a substituted cycloalkyl will have 1-4 substituents unless otherwise specified. Suitable substituents, unless otherwise specified, are independently selected from the group consisting of halogen, hydroxyl, thiol, cyano, nitro, oxo, C1-C4-alkylimino, C1-C4-alkoximino, hydroxyimino, C1-C4-alkyl, C2-C4-alkenyl, C2-C4-alkynyl, C1-C4-alkoxy, C1-C4-thioalkyl, C2-C4-alkenyloxy, C2-C4-alkynyloxy, C1-C4-alkylcarbonyl, carboxy, C1-C4-alkoxycarbonyl, amino, C1-C4-alkylamino, di-C1-C4-alkylamino, C1-C4-alkylaminocarbonyl, di-C1-C4-alkylaminocarbonyl, C1-C4-alkylcarbonylamino, C1-C4-alkylcarbonyl(C1-C4-alkyl)amino, C1-C4-alkylsulfonyl, C1-C4-alkylsulfamoyl, and C1-C4-alkylaminosulfonyl, where each of the aforementioned hydrocarbon groups (e.g., alkyl, alkenyl, alkynyl, alkoxy residues) may be further substituted by one or more groups independently selected at each occurrence from the list of substituents for 'alkyl' groups herein. [0028] As used herein, the term "heterocyclyl" refers to a heterocyclic radical that is saturated or partially unsaturated but not aromatic, and can be a monocyclic or a polycyclic ring (in case of a polycyclic ring particularly a bicyclic, tricyclic or spirocyclic ring); and has 3 to 14, more commonly 4 to 10, and most preferably 5 or 6 ring atoms; wherein one or more, preferably one to four, especially one or two ring atoms are heteroatoms independently selected from O, S and N (the remaining ring atoms therefore being carbon). Even if it is described as, e.g., a C5-6 atom ring, a heterocycle contains at least one heteroatom as a ring atom with the other ring atoms being carbon, and has the number of ring atoms stated, e.g. 5-6 in this example. Preferably, a heterocyclyl group has one or two such heteroatoms as ring atoms, and preferably the heteroatoms are not directly connected to each other. The bonding ring (i.e. the ring connecting to the Formula of interest) preferably has 4 to 12, especially 5 to 7 ring atoms unless otherwise specified. The heterocyclic group can be fused to an aromatic ring, provided the atom of the heterocyclic group attached to the Formula of interest is not aromatic. The heterocyclic group can be attached to the Formula of interest via a heteroatom (typically nitrogen) or a carbon atom of the heterocyclic group. The heterocyclyl can include fused or bridged rings as well as spirocyclic rings, and only one ring of a polycyclic heterocyclic group needs to contain a heteroatom as a ring atom. Examples of heterocycles include tetrahydrofuran (THF), dihydrofuran, 1,4-dioxane, morpholine, 1,4-dithiane, piperazine, piperidine, 1,3-dioxolane, imidazolidine, imidazoline, pyrroline, pyrrolidine, tetrahydropyran, dihydropyran, oxathiolane, dithiolane, 1,3-dioxane, 1,3-dithiane, oxathiane, thiomorpholine, and the like.

[0067] As used herein, the term “an optical isomer” or “a stereoisomer” refers to any of the various stereo isomeric configurations which may exist for a given compound of the present

invention and includes geometric isomers. It is understood that a substituent may be attached at a chiral center of a carbon atom. The term "chiral" refers to molecules which have the property of non-superimposability on their mirror image partner, while the term "achiral" refers to molecules which are superimposable on their mirror image partner. Therefore, the invention includes enantiomers, diastereomers or racemates of the compound. "Enantiomers" are a pair of stereoisomers that are non-superimposable mirror images of each other. A 1:1 mixture of a pair of enantiomers is a "racemic" mixture. The term is used to designate a racemic mixture where appropriate. "Diastereoisomers" are stereoisomers that have at least two asymmetric atoms, but which are not mirror-images of each other. The absolute stereochemistry is specified according to the Cahn-Ingold-Prelog 'R-S' system. When a compound is a pure enantiomer, the stereochemistry at each chiral carbon may be specified by either R or S. Resolved compounds whose absolute configuration is unknown can be designated (+) or (-) depending on the direction (dextro- or levorotatory) which they rotate plane polarized light at the wavelength of the sodium D line. Certain compounds described herein contain one or more asymmetric centers or axes and may thus give rise to enantiomers, diastereomers, and other stereoisomeric forms that may be defined, in terms of absolute stereochemistry, as (R)- or (S)-.

[0068] Depending on the choice of the starting materials and synthesis procedures, the compounds can be present in the form of one of the possible isomers or as mixtures thereof, for example as pure optical isomers, or as isomer mixtures, such as racemates and diastereoisomer mixtures, depending on the number of asymmetric carbon atoms. The present invention is meant to include all such possible isomers, including racemic mixtures, diastereomeric mixtures and optically pure forms. Optically active (R)- and (S)- isomers may be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques. If the compound contains a double bond, the substituent may be E or Z configuration unless specified. If the compound contains a di-substituted cycloalkyl, the cycloalkyl substituent may have a cis- or trans-configuration, unless otherwise specified. All tautomeric forms are also intended to be included.

[0069] In many cases, the compounds of the present invention are capable of forming acid and/or base salts by virtue of the presence of amino and/or carboxyl groups or groups similar thereto. As used herein, the terms "salt" or "salts" refers to an acid addition or base addition salt of a compound of the invention. "Salts" include in particular "pharmaceutical acceptable salts". The term "pharmaceutically acceptable salts" refers to salts that retain the biological effectiveness and properties of the compounds of this invention and, which typically are not biologically or otherwise undesirable.

[0070] Pharmaceutically acceptable acid addition salts can be formed with inorganic acids and organic acids, e.g., acetate, aspartate, benzoate, besylate, bromide/hydrobromide, bicarbonate/carbonate, bisulfate/sulfate, camphorsulfonate, chloride/hydrochloride, chlorotheophyllinate, citrate, ethanedisulfonate, fumarate, gluceptate, gluconate, glucuronate, hippurate, hydroiodide/iodide, isethionate, lactate, lactobionate, laurylsulfate, malate, maleate, malonate, mandelate, mesylate, methylsulphate, naphthoate, napsylate, nicotinate, nitrate, octadecanoate, oleate, oxalate, palmitate, pamoate, phosphate/hydrogen phosphate/dihydrogen phosphate, polygalacturonate, propionate, stearate, succinate, sulfosalicylate, tartrate, tosylate and trifluoroacetate salts. Lists of additional suitable salts can be found, e.g., in "Remington's Pharmaceutical Sciences", 20th ed., Mack Publishing Company, Easton, Pa., (1985); and in "Handbook of Pharmaceutical Salts: Properties, Selection, and Use" by Stahl and Wermuth (Wiley-VCH, Weinheim, Germany, 2002).

[0071] Inorganic acids from which salts can be derived include, for example, hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, and the like.

[0072] Organic acids from which salts can be derived include, for example, acetic acid, propionic acid, glycolic acid, oxalic acid, maleic acid, malonic acid, succinic acid, fumaric acid, tartaric acid, citric acid, benzoic acid, mandelic acid, methanesulfonic acid, ethanesulfonic acid, toluenesulfonic acid, sulfosalicylic acid, and the like.

[0073] Pharmaceutically acceptable base addition salts can be formed with inorganic or organic bases and can have inorganic or organic counterions.

[0074] Inorganic counterions for such base salts include, for example, ammonium salts and metals from columns I to XII of the periodic table. In certain embodiments, the counterion is selected from sodium, potassium, ammonium, alkylammonium having one to four C1-C4 alkyl groups, calcium, magnesium, iron, silver, zinc, and copper; particularly suitable salts include ammonium, potassium, sodium, calcium and magnesium salts.

[0075] Organic bases from which salts can be derived include, for example, primary, secondary, and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines, basic ion exchange resins, and the like. Suitable organic amines include isopropylamine, benzathine, choline, diethanolamine, diethylamine, lysine, meglumine, piperazine and tromethamine.

[0076] The pharmaceutically acceptable salts of the present invention can be synthesized from a basic or acidic moiety, by conventional chemical methods. Generally, such salts can be prepared by reacting free acid forms of these compounds with a stoichiometric amount of the appropriate base (such as Na, Ca, Mg, or K hydroxide, carbonate, bicarbonate or the like), or by

reacting free base forms of these compounds with a stoichiometric amount of the appropriate acid. Such reactions are typically carried out in water or in an organic solvent, or in a mixture of the two. Generally, use of non-aqueous media like ether, ethyl acetate, tetrahydrofuran, toluene, chloroform, dichloromethane, methanol, ethanol, isopropanol, or acetonitrile is desirable, where practicable.

[0077] Any formula given herein is also intended to represent unlabeled forms (i.e., compounds wherein all atoms are present at natural isotopic abundances, and not isotopically enriched) as well as isotopically enriched or labeled forms of the compounds. Isotopically enriched or labeled compounds have structures depicted by the formulas given herein except that at least one atom of the compound is replaced by an atom having an atomic mass or mass number different from the atomic mass or the atomic mass distribution that occurs naturally. Examples of isotopes that can be incorporated into enriched or labeled compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine, and chlorine, such as 2H , 3H , 11C , 13C , 14C , 15N , 18F , 31P , 32P , 35S , 36Cl , and 125I . The invention includes various isotopically labeled compounds as defined herein, for example those in which radioactive isotopes, such as 3H and 14C , or those in which non-radioactive isotopes, such as 2H and 13C , are present at levels significantly above the natural abundance for these isotopes. These isotopically labeled compounds are useful in metabolic studies (e.g., with 14C), reaction kinetic studies (with, for example 2H or 3H), detection or imaging techniques, such as positron emission tomography (PET) or single-photon emission computed tomography (SPECT) including drug or substrate tissue distribution assays, or in radioactive treatment of patients. In particular, an 18F labeled compound may be particularly desirable for PET or SPECT studies. Isotopically-labeled compounds of formula (I) can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the accompanying Examples using an appropriate isotopically-labeled reagent in place of the non-labeled reagent otherwise employed.

[0078] Further, substitution with heavier isotopes, particularly deuterium (i.e., 2H or D) may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements or an improvement in therapeutic index. The concentration of such a heavier isotope, specifically deuterium, may be defined by the isotopic enrichment factor. The term "isotopic enrichment factor" as used herein means the ratio between the isotopic abundance and the natural abundance of a specified isotope. If a substituent in a compound of this invention is denoted deuterium, such compound has an isotopic enrichment factor for each designated deuterium atom of at least 3500 (52.5%

deuterium incorporation at each designated deuterium atom), at least 4000 (60% deuterium incorporation), at least 4500 (67.5% deuterium incorporation), at least 5000 (75% deuterium incorporation), at least 5500 (82.5% deuterium incorporation), at least 6000 (90% deuterium incorporation), at least 6333.3 (95% deuterium incorporation), at least 6466.7 (97% deuterium incorporation), at least 6600 (99% deuterium incorporation), or at least 6633.3 (99.5% deuterium incorporation).

[0079] Pharmaceutically acceptable solvates in accordance with the invention include those wherein the solvent of crystallization may be isotopically substituted, e.g. D₂O, d₆-acetone, d₆-DMSO, as well as solvates with non-enriched solvents.

[0080] Compounds of the invention, i.e., compounds of formula (I) that contain groups capable of acting as donors and/or acceptors for hydrogen bonds may be capable of forming co-crystals with suitable co-crystal formers. These co-crystals may be prepared from compounds of formula (I) by known co-crystal forming procedures. Such procedures include grinding, heating, co-subliming, co-melting, or contacting in solution compounds of formula (I) with the co-crystal former under crystallization conditions and isolating co-crystals thereby formed. Suitable co-crystal formers include those described in WO2004/078163. Hence the invention further provides co-crystals comprising a compound of formula (I).

[0081] As used herein, the term "pharmaceutically acceptable carrier" includes any and all solvents, dispersion media, coatings, surfactants, antioxidants, preservatives (e.g., antibacterial agents, antifungal agents), isotonic agents, absorption delaying agents, salts, preservatives, drug stabilizers, binders, excipients, disintegration agents, lubricants, sweetening agents, flavoring agents, dyes, and the like and combinations thereof, as would be known to those skilled in the art for use in a pharmaceutical composition for administration to a human subject (see, for example, Remington: The Science and Practice of Pharmacy, 22nd ed.). Except insofar as any conventional carrier is incompatible with the active ingredient, its use in the therapeutic or pharmaceutical compositions is contemplated.

[0082] The term "a therapeutically effective amount" of a compound of the present invention refers to an amount of the compound of the present invention that will elicit the biological or medical response in a subject, for example, an amount sufficient to reduce of one or more symptoms, alleviate conditions, slow or delay disease progression, or prevent a disease, etc. In one non-limiting embodiment, the term "a therapeutically effective amount" refers to the amount of a compound of the present invention that, when administered to a subject, is effective to reduce one or more symptoms associated with an influenza virus infection, or to shorten the duration of the symptomatic stage of an influenza virus infection, or to slow the progression of

an influenza virus infection, or to reduce or stop the exacerbation of an underlying condition by an influenza virus infection.

[0083] In another non-limiting embodiment, the term "a therapeutically effective amount" refers to the amount of the compound of the present invention that, when administered to a cell, or a tissue, or a non-cellular biological material, or a medium, is effective to cause a statistically significant reduction in rate of replication or proliferation of a strain of orthomyxovirus.

[0084] As used herein, the term "subject" refers to an animal. Typically, the subject is a human.

[0085] As used herein, the term "inhibit", "inhibition" or "inhibiting" refers to the reduction or suppression of a given condition, symptom, or disorder, or disease, or a significant decrease in the baseline activity of a biological activity or process.

[0086] As used herein, the term "treat", "treating" or "treatment" of any disease or disorder refers in one embodiment, to ameliorating the disease or disorder (i.e., slowing or arresting or reducing the development of the disease or at least one of the clinical symptoms thereof). In another embodiment "treat", "treating" or "treatment" refers to alleviating or ameliorating at least one physical parameter including those which may not be discernible by the patient. In yet another embodiment, "treat", "treating" or "treatment" refers to modulating the disease or disorder, either physically, (e.g., stabilization of a discernible symptom), physiologically, (e.g., stabilization of a physical parameter), or both. In yet another embodiment, "treat", "treating" or "treatment" refers to preventing or delaying the development or progression of the disease or disorder.

[0087] As used herein, a subject is "in need of" a treatment if such subject would benefit biologically, medically or in quality of life from such treatment.

[0088] As used herein, the term "a," "an," "the" and similar terms used in the context of the present invention (especially in the context of the claims) are to be construed to cover both the singular and plural unless otherwise indicated herein or clearly contradicted by the context.

[0089] All methods described herein can be performed in any suitable order unless otherwise indicated herein or otherwise clearly contradicted by context. The use of any and all examples, or exemplary language (e.g. "such as") provided herein is intended merely to better illuminate the invention and does not pose a limitation on the scope of the invention otherwise claimed.

[0090] Any asymmetric atom (e.g., carbon or the like) of the compound(s) of the present invention can be present in racemic or enantiomerically enriched, for example the (R)-, (S)- or (R,S)- configuration. In certain embodiments, each asymmetric atom has at least 50 %

enantiomeric excess, at least 60 % enantiomeric excess, at least 70 % enantiomeric excess, at least 80 % enantiomeric excess, at least 90 % enantiomeric excess, at least 95 % enantiomeric excess, or at least 99 % enantiomeric excess of either the (R)- or (S)- configuration; i.e., for optically active compounds, it is often preferred to use one enantiomer to the substantial exclusion of the other enantiomer, so typically an enantiomeric purity of at least 95% is preferred. Substituents at atoms with unsaturated double bonds may, if possible, be present in cis- (Z)- or trans- (E)- form.

[0091] Accordingly, as used herein a compound of the present invention can be in the form of one of the possible isomers, rotamers, atropisomers, tautomers or mixtures thereof, for example, as substantially pure geometric (cis or trans) isomers, diastereomers, optical isomers (antipodes), racemates or mixtures thereof. 'Substantially pure' or 'substantially free of other isomers' as used herein means the product contains less than 5%, and preferably less than 2%, of other isomers relative to the amount of the preferred isomer, by weight.

[0092] Resulting mixtures of isomers can typically be separated on the basis of the physicochemical differences of the constituents, into the pure or substantially pure geometric or optical isomers, diastereomers, racemates, for example, by chromatography and/or fractional crystallization.

[0093] Racemates of final products or intermediates can typically be resolved into the optical antipodes by known methods, e.g., by separation of the diastereomeric salts thereof, obtained with an optically active acid or base, and liberating the optically active acidic or basic compound. In particular, a basic moiety may thus be employed to resolve the compounds of the present invention into their optical antipodes, e.g., by fractional crystallization of a salt formed with an optically active acid, e.g., tartaric acid, dibenzoyl tartaric acid, diacetyl tartaric acid, di-O,O'-p-toluoyl tartaric acid, mandelic acid, malic acid or camphor-10-sulfonic acid. Racemic products can also be resolved by chiral chromatography, e.g., high pressure liquid chromatography (HPLC) using a chiral stationary phase.

[0094] Furthermore, the compounds of the present invention, including their salts, can also be obtained in the form of their hydrates, or include other solvents used for their crystallization. The compounds of the present invention may inherently or by design form solvates with pharmaceutically acceptable solvents (including water); therefore, it is intended that the invention embrace both solvated and unsolvated forms. The term "solvate" refers to a molecular complex of a compound of the present invention (including pharmaceutically acceptable salts thereof) with one or more solvent molecules. Such solvent molecules are those commonly used

in the pharmaceutical art, which are known to be innocuous to the recipient, e.g., water, ethanol, and the like. The term "hydrate" refers to the complex where the solvent molecule is water.

[0095] In another aspect, the present invention provides a pharmaceutical composition comprising a compound of the present invention, or a pharmaceutically acceptable salt thereof, and at least one pharmaceutically acceptable carrier. In some embodiments, the pharmaceutical composition comprises at least two pharmaceutically acceptable excipients or carriers. Pharmaceutically acceptable carriers and other excipients are known to those of skill in the art, and may be selected, for example, from carriers and excipients used in approved (registered) formulated therapeutic agents that are administered via similar routes of administration. The pharmaceutical composition can be formulated for particular routes of administration such as oral administration, parenteral administration, and rectal administration, and the like. In addition, the pharmaceutical compositions of the present invention can be made up in a solid form (including without limitation capsules, tablets, pills, granules, powders or suppositories), or in a liquid form (including without limitation solutions, suspensions or emulsions). The pharmaceutical compositions can be subjected to conventional pharmaceutical operations such as sterilization and/or can contain conventional inert diluents, lubricating agents, or buffering agents, as well as adjuvants, such as preservatives, stabilizers, wetting agents, emulsifiers and buffers, etc.

[0096] In one embodiment, the compounds of the invention are formulated for oral delivery. Typically, these pharmaceutical compositions are tablets or gelatin capsules comprising the active ingredient (at least one compound of Formula (I)) together with one or more excipients selected from:

- a) diluents, e.g., lactose, dextrose, sucrose, mannitol, sorbitol, cellulose and/or glycine;
- b) lubricants, e.g., silica, talcum, stearic acid, its magnesium or calcium salt and/or polyethyleneglycol; for tablets also
- c) binders, e.g., magnesium aluminum silicate, starch paste, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose and/or polyvinylpyrrolidone; if desired
- d) disintegrants, e.g., starches, agar, alginic acid or its sodium salt, or effervescent mixtures; and/or
- e) absorbents, colorants, flavors and sweeteners.

[0097] Tablets may be either film coated or enteric coated according to methods known in the art.

[0098] Suitable compositions for oral administration include an effective amount of a compound of the invention in the form of tablets, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsion, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use are prepared according to any method known in the art for the manufacture of pharmaceutical compositions and such compositions can contain one or more agents selected from the group consisting of sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets may contain the active ingredient in admixture with nontoxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients are, for example, inert diluents, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or sodium phosphate; granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example, starch, gelatin or acacia; and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets are uncoated or coated by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate can be employed. Formulations for oral use can be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example, peanut oil, liquid paraffin or olive oil.

[0099] Certain injectable compositions are aqueous isotonic solutions or suspensions, and suppositories are advantageously prepared from fatty emulsions or suspensions. Said compositions may be sterilized and/or contain adjuvants, such as preserving, stabilizing, wetting or emulsifying agents, solution promoters, salts for regulating the osmotic pressure and/or buffers. In addition, they may also contain other therapeutically valuable substances. Said compositions are prepared according to conventional mixing, granulating or coating methods, respectively, and contain about 0.1-75%, or contain about 1-50%, of the active ingredient.

[00100] Suitable compositions for transdermal application include an effective amount of a compound of the invention with a suitable carrier. Carriers suitable for transdermal delivery include absorbable pharmacologically acceptable solvents to assist passage through the skin of the host. For example, transdermal devices are in the form of a bandage comprising a backing member, a reservoir containing the compound optionally with carriers, optionally a rate controlling barrier to deliver the compound of the skin of the host at a controlled and predetermined rate over a prolonged period of time, and means to secure the device to the skin.

[00101] Suitable compositions for topical application, e.g., to the skin and eyes, include aqueous solutions, suspensions, ointments, creams, gels or sprayable formulations, e.g., for delivery by aerosol or the like. Such topical delivery systems may pertain to an inhalation or to an intranasal application that may be suitable for use to treat influenza, for example, and may contain solubilizers, stabilizers, tonicity enhancing agents, buffers and preservatives. They may be conveniently delivered in the form of a dry powder (either alone, as a mixture, for example a dry blend with lactose, or a mixed component particle, for example with phospholipids) from a dry powder inhaler or an aerosol spray presentation from a pressurized container, pump, spray, atomizer or nebulizer, with or without the use of a suitable propellant.

[00102] The present invention further provides anhydrous pharmaceutical compositions and dosage forms comprising the compounds of the present invention as active ingredients, since water may facilitate the degradation of certain compounds.

[00103] Anhydrous pharmaceutical compositions and dosage forms of the invention can be prepared using anhydrous or low moisture containing ingredients and low moisture or low humidity conditions. An anhydrous pharmaceutical composition may be prepared and stored such that its anhydrous nature is maintained. Scheme A depicts a way to prepare compounds wherein Z1 is N, Z2 is C(R)₂, and Z3 is -CR₂-CR₂-, and should also enable synthesis of compounds with other Z3 linkages. It begins with a 5-hydroxypyridazine-4-one-3-carboxylic acid compound, where both the 5-hydroxy and the ring NH are protected with a suitable protecting group that can readily be removed. The carboxylic acid is condensed with a cyclic hydrazine linkage to provide the two outer rings. After deprotection of the ring nitrogen, the center ring is formed by condensation with an aldehyde.

Compound 1. 1-benzyl-5-(benzyloxy)-4-oxo-1,4-dihydropyridazine-3-carboxylic acid hydrochloride

[00127] To a suspension of ethyl 5-(benzyloxy)-4-oxo-1,4-dihydropyridazine-3-carboxylate hydrochloride (50 g, 161 mmol: see US 2015/0072982 A1) in MeOH (800 mL) at RT was added NaOH (26.4 g, 660 mmol). Stirred at rt for 10 min. Benzyl bromide (99 g, 579 mmol) was added and the mixture stirred for 2 hours. The reaction was concentrated, then water was added to the residue. The mixture was then acidified with 2 M HCl to pH 2, causing a white precipitate to form. The white solid was collected by vacuum filtration and washed with water. The white solid collected on the filter was dried under vacuum to give 1-benzyl-5-(benzyloxy)-4-oxo-1,4-dihydropyridazine-3-carboxylic acid hydrochloride (57.5 g, 154 mmol, 96% yield), which was used without further purification. MS m/z 337.3 ($M+1$).

General Synthesis of Chiral N-CBZ Amino Alcohols

Step G-1: tert-butyl (R,E)-2-(4-fluorostyryl)pyrrolidine-1-carboxylate

[00128] A solution of lithium bis(trimethylsilyl)amide (1.0 M in THF, 78 mL, 78 mmol) was added dropwise to a solution of diethyl (4-fluorobenzyl)phosphonate (19.5 g, 79 mmol) in THF

(100 mL) at 0 °C. Stirred at 0 °C for 20 min, then added a solution of (R)-tert-butyl 2-formylpyrrolidine-1-carboxylate (15 g, 75 mmol) in THF (40 mL) dropwise. The reaction mixture was stirred 0 °C for 1 h and then slowly warmed to RT over 1 h and then stirred for an additional 2 h at RT. The reaction was quenched with water and extracted with EtOAc (twice). The combined organic extracts were washed with brine, dried over Na₂SO₄, filtered and concentrated. Silica gel column chromatography (EtOAc/heptane) provided tert-butyl (R,E)-2-(4-fluorostyryl)pyrrolidine-1-carboxylate (11.65 g, colorless oil) in 53% yield. MS m/z 236.3 (M-tBu+H).

Step G-2: (R,E)-2-(4-fluorostyryl)pyrrolidine hydrochloride

[00129] Added a solution of HCl (4.0 M in dioxane, 29.6 ml, 118 mmol) to tert-butyl (R,E)-2-(4-fluorostyryl)pyrrolidine-1-carboxylate (11.5 g, 39.5 mmol) at RT and stirred for 1 h. The reaction mixture was then concentrated to give crude (R,E)-2-(4-fluorostyryl)pyrrolidine hydrochloride, which was used in the next step without further purification. MS m/z 192.1 (MH⁺).

Step G-3: benzyl (R,E)-2-(4-fluorostyryl)pyrrolidine-1-carboxylate

[00130] Benzyl chloroformate (6.8 ml, 47.4 mmol) was added dropwise to a solution of triethylamine (13.8 ml, 99.9 mmol) and (R,E)-2-(4-fluorostyryl)pyrrolidine hydrochloride (8.99 g, 39.5 mmol) in DCM (200 ml) at 0 °C and the mixture was allowed to warm to RT and stirred overnight. The reaction was then diluted with additional DCM, washed successively with water then brine, dried with Na₂SO₄, filtered and concentrated. Silica gel column chromatography (EtOAc/heptane) provided benzyl (R,E)-2-(4-fluorostyryl)pyrrolidine-1-carboxylate (11.6 g, colorless oil) in 90% yield over two steps. MS m/z 348.2 (M+Na)⁺.

[00131] To a solution of benzyl (R,E)-2-(4-fluorostyryl)pyrrolidine-1-carboxylate (3.5 g, 10.8 mmol) in DCM (200 mL) was added sodium bicarbonate (4.52 g, 53.8 mmol) and mCPBA (70%, 13.3 g, 53.8 mmol). The reaction mixture was stirred at RT for 2 h. Additional DCM (50 mL) was added and stirred for another 1 h. The reaction was quenched with water and extracted with DCM (twice). The combined organic extracts were washed sequentially with saturated aqueous Na₂S₂O₃, saturated aqueous NaHCO₃ and brine. The organic layer was then dried over Na₂SO₄, filtered and concentrated. Silica gel column chromatography (EtOAc/heptane) provided an inseparable mixture of benzyl (R)-2-((2S,3S)-3-(4-fluorophenyl)oxiran-2-yl)pyrrolidine-1-

carboxylate and benzyl (R)-2-((2R,3R)-3-(4-fluorophenyl)oxiran-2-yl)pyrrolidine-1-carboxylate (2.25 g, colorless oil) in 61% yield. The mixture was used in the next step without further purification. MS m/z 342.4 (MH⁺).

Cooled to between -20 and -30 °C in an acetone bath with periodic dry ice additions. A solution of (3-(trifluoromethyl)phenyl)magnesium bromide (0.25 M in THF, 35.2 mL, 8.79 mmol) was added dropwise. Stirred 10 min and allowed the temperature to warm to 0 °C. Added 2 equiv more of (3-(trifluoromethyl)phenyl)magnesium bromide and stirred another 30 min. The reaction was quenched with saturated aqueous NH₄Cl solution and extracted with EtOAc (2 times). The combined organic extracts were dried over Na₂SO₄, filtered and concentrated. Silica gel column chromatography (EtOAc/heptane) provided benzyl (R)-2-((1R,2S)-2-(4-fluorophenyl)-1-hydroxy-2-(3-(trifluoromethyl)phenyl)ethyl)pyrrolidine-1-carboxylate (195 mg, colorless oil, eluted first) in 18% yield and benzyl (R)-2-((1S,2R)-2-(4-fluorophenyl)-1-hydroxy-2-(3-(trifluoromethyl)phenyl)ethyl)pyrrolidine-1-carboxylate (440 mg, eluted second) in 41% yield. Example 20. (9aR,10S)-10-((R)-(4-fluorophenyl)(3-(trifluoromethyl)phenyl)methyl)-4-hydroxy-8,9,9a,10-tetrahydro-7H-pyrrolo[1',2':4,5]pyrazino[1,2-b]pyridazine-3,5-dione

Step 1: benzyl (R)-2-((1S,2R)-2-(4-fluorophenyl)-1-((methanesulfonyl)oxy)-2-(3-(trifluoromethyl)phenyl)ethyl)pyrrolidine-1-carboxylate

[00139] To a solution of benzyl (R)-2-((1S,2R)-2-(4-fluorophenyl)-1-hydroxy-2-(3-(trifluoromethyl)phenyl)ethyl)pyrrolidine-1-carboxylate (440 mg, 0.90 mmol) in pyridine (8 mL) at 0 °C was added methanesulfonyl chloride (1.1 mL, 13.5 mmol). After 5 min, the ice bath was removed and the reaction was stirred for 2h at RT. The reaction mixture was partitioned between DCM and water. The DCM layer was separated and washed sequentially with 1N aqueous HCl, saturated aqueous NaHCO₃ and brine. The organic layer was dried over Na₂SO₄, filtered and concentrated. Silica gel column chromatography (EtOAc/heptane) provided benzyl (R)-2-((1S,2R)-2-(4-fluorophenyl)-1-((methanesulfonyl)oxy)-2-(3-(trifluoromethyl)phenyl)ethyl)pyrrolidine-1-carboxylate (450 mg) in 88% yield. MS m/z 566.5 (MH⁺).

Step 2: (1R,7aR)-1-((R)-(4-fluorophenyl)(3-(trifluoromethyl)phenyl)methyl)tetrahydro-1H,3H-pyrrolo[1,2-c]oxazol-3-one

[00140] A solution of benzyl (R)-2-((1S,2R)-2-(4-fluorophenyl)-1-((methylsulfonyl)oxy)-2-(3-(trifluoromethyl)phenyl)ethyl)pyrrolidine-1-carboxylate (450 mg, 0.796 mmol) in pyridine (8 mL) was heated at 155 °C for 3 h in a microwave reactor. Silica gel column chromatography (EtOAc/heptane) provided (1R,7aR)-1-((R)-(4-fluorophenyl)(3-(trifluoromethyl)phenyl)methyl)tetrahydro-1H,3H-pyrrolo[1,2-c]oxazol-3-one (175 mg) in 58% yield. MS m/z 380.5 (MH⁺).

Step 3: (1R,2R)-2-(4-fluorophenyl)-1-((R)-pyrrolidin-2-yl)-2-(3-(trifluoromethyl)phenyl)ethan-1-ol hydrochloride

[00141] Added 6N aqueous HCl solution to a solution of (1R,7aR)-1-((R)-(4-fluorophenyl)(3-(trifluoromethyl)phenyl)methyl)tetrahydro-1H,3H-pyrrolo[1,2-c]oxazol-3-one (175 mg, 0.461 mmol) in dioxane (2.5 mL) and the mixture was heated at 95 °C for 2 days in a sealed vial until the reaction was complete. The reaction was then concentrated to afford crude (1R,2R)-2-(4-fluorophenyl)-1-((R)-pyrrolidin-2-yl)-2-(3-(trifluoromethyl)phenyl)ethan-1-ol hydrochloride, which was used in the next step without further purification. MS m/z 354.3 (MH⁺).

Step 4: 1-benzyl-5-(benzyloxy)-3-((R)-2-((1R,2R)-2-(4-fluorophenyl)-1-hydroxy-2-(3-(trifluoromethyl)phenyl)ethyl)pyrrolidine-1-carbonyl)pyridazin-4(1H)-one

[00142] Added Huenig's Base (0.32 mL, 1.8 mmol) and HATU (224 mg, 0.589 mmol) to a solution of 1-benzyl-5-(benzyloxy)-4-oxo-1,4-dihydropyridazine-3-carboxylic acid hydrochloride (168 mg, 0.498 mmol) in DCM (4 mL) at RT. Stirred at RT for 15 min, then added a solution of crude (1R,2R)-2-(4-fluorophenyl)-1-((R)-pyrrolidin-2-yl)-2-(3-(trifluoromethyl)phenyl)ethan-1-ol hydrochloride (160 mg, 0.453 mmol) in DCM (4 mL) and Huenig's Base (0.32 mL, 1.8 mmol). The mixture was stirred at RT for 60 min. The mixture was then diluted with DCM and washed with water and brine. The organic layer was dried over Na₂SO₄, filtered and concentrated. Silica gel column chromatography (EtOAc/EtOH/heptane) provided 1-benzyl-5-(benzyloxy)-3-((R)-2-((1R,2R)-2-(4-fluorophenyl)-1-hydroxy-2-(3-(trifluoromethyl)phenyl)ethyl)pyrrolidine-1-carbonyl)pyridazin-4(1H)-one (290 mg, 0.432 mmol) in 95% yield. MS m/z 672.7 (MH⁺).

Step 5: (1R,2R)-1-((R)-1-(1-benzyl-5-(benzyloxy)-4-oxo-1,4-dihydropyridazine-3-carbonyl)pyrrolidin-2-yl)-2-(4-fluorophenyl)-2-(3-(trifluoromethyl)phenyl)ethyl methanesulfonate

[00143] To a solution of 1-benzyl-5-(benzyloxy)-3-((R)-2-((1R,2R)-2-(4-fluorophenyl)-1-hydroxy-2-(3-(trifluoromethyl)phenyl)ethyl)pyrrolidine-1-carbonyl)pyridazin-4(1H)-one (300 mg, 0.447 mmol) in 2,6-lutidine (6 mL) was added methanesulfonyl chloride (0.52 mL, 6.7 mmol) in

an ice bath. After 5 min, the bath was removed and reaction mixture was stirred for 4 h at RT. The reaction mixture was then partitioned between DCM and water. The DCM layer was separated and washed sequentially with 1N aqueous HCl, saturated aqueous NaHCO₃ and brine. The DCM layer was then dried over Na₂SO₄, filtered and concentrated. Silica gel column chromatography (EtOAc/heptane) provided (1R,2R)-1-((R)-1-(1-benzyl-5-(benzyloxy)-4-oxo-1,4-dihydropyridazine-3-carbonyl)pyrrolidin-2-yl)-2-(4-fluorophenyl)-2-(3-(trifluoromethyl)phenyl)ethyl methanesulfonate (280 mg, 0.373) in 84% yield. MS m/z 750.7 (MH⁺).

Step 6: (1R,2R)-2-(4-fluorophenyl)-1-((R)-1-(5-hydroxy-4-oxo-1,4-dihydropyridazine-3-carbonyl)pyrrolidin-2-yl)-2-(3-(trifluoromethyl)phenyl)ethyl methanesulfonate

[00144] To a solution of (1R,2R)-1-((R)-1-(1-benzyl-5-(benzyloxy)-4-oxo-1,4-dihydropyridazine-3-carbonyl)pyrrolidin-2-yl)-2-(4-fluorophenyl)-2-(3-(trifluoromethyl)phenyl)ethyl methanesulfonate (280 mg, 0.373 mmol) in methanol (10 mL) was added HCl (4.0 M in dioxane, 0.19 mL, 0.75 mmol) then the solution was purged with nitrogen. Added 10% palladium on carbon (199 mg) and attached a hydrogen balloon. The flask was evacuated and refilled with hydrogen (3 times) and then stirred vigorously for 2 h at RT under a balloon of hydrogen. Added more palladium on carbon (199 mg) and stirred for another 3 h at RT. The reaction mixture was filtered through celite, and the filter cake was washed with MeOH. The filtrate was concentrated to give crude (1R,2R)-2-(4-fluorophenyl)-1-((R)-1-(5-hydroxy-4-oxo-1,4-dihydropyridazine-3-carbonyl)pyrrolidin-2-yl)-2-(3-(trifluoromethyl)phenyl)ethyl methanesulfonate, which was used in the next step without further purification. MS m/z 570.5 (MH⁺).

Step 7: (9aR,10S)-10-((R)-(4-fluorophenyl)(3-(trifluoromethyl)phenyl)methyl)-4-hydroxy-8,9,9a,10-tetrahydro-7H-pyrrolo[1',2':4,5]pyrazino[1,2-b]pyridazine-3,5-dione

[00145] To a solution of crude (1R,2R)-2-(4-fluorophenyl)-1-((R)-1-(5-hydroxy-4-oxo-1,4-dihydropyridazine-3-carbonyl)pyrrolidin-2-yl)-2-(3-(trifluoromethyl)phenyl)ethyl methanesulfonate (210 mg, 0.369 mmol) in DMF (6 mL) was added potassium carbonate (204 mg, 1.48 mmol) and the mixture was stirred overnight at RT. The reaction was filtered through a 1 micron filter and purified by reverse phase HPLC. Product fractions were combined, frozen and lyophilized to afford a formate salt of (9aR,10S)-10-((R)-(4-fluorophenyl)(3-(trifluoromethyl)phenyl)methyl)-4-hydroxy-8,9,9a,10-tetrahydro-7H-pyrrolo[1',2':4,5]pyrazino[1,2-b]pyridazine-3,5-dione (30 mg, 0.112 mmol, white solid) in 30% yield over two steps. ¹H NMR (400 MHz, MeOD) δppm 7.88 (br s, 2 H) 7.62 (br s, 2 H) 7.36 - 7.48 (m, 1 H) 6.89 - 7.05 (m, 2 H) 6.82 (br t, J=8.41 Hz, 2 H) 5.83

Influenza Virus Minigenome Assays (RNP Assay)

[00193] For influenza A virus minigenome reporter assays, 293T cells were transfected with expression vectors encoding PB2, PB1, PA, NP proteins and an influenza A Luciferase reporter plasmid. Cells were harvested in Dulbecco's modified Eagle's medium (DMEM) minus phenol red, supplemented with 10% heat inactivated FBS (fetal bovine serum), 1% sodium pyruvate and 1% L-glutamine (Cellgro, Manassas, VA). The five plasmids were co-transfected with Eugene 6 transfection reagent (Promega, Madison, WI) with a 1:3 ratio DNA (μg):Eugene 6 (μl), in OptiMEM® (Gibco, Carlsbad, CA). Transfections were performed at cell densities of 1.8×10^4 cells/well in 384-well format. Compounds were added 2 hours post-transfection, and plates were incubated at 37°C, 5% CO₂ for 48 hours. Following incubation, cells were lysed and luciferase production quantified by addition of Britelite Plus® (Perkin-Elmer, Waltham, MA). For cell toxicity measurement, CellTiter-Glo® (Promega, Madison, WI) was added to treated cells following manufacturer's instructions.
