Method and Apparatus for Accessing a Computer-Based File System

Abstract

A computer-based file system accesses stored data objects using file access system calls. The user search request includes a file access system call including a purported file name containing one or more search criteria which are used to identify one or more stored data objects meeting the search criteria. The search criteria may identify a single-data object or multiple-data objects. Multiple-data objects are stored in a virtual directory to facilitate subsequent data object access by the user.
