FIELD OF THE INVENTION

This invention pertains to N-[4-(3-Amino-1H-indazol-4-yl)phenyl]-N'-(2-fluoro-5-methylphenyl)urea·¼ Ethanolate Crystalline Form 1, ways to make it, formulations comprising it and made with it and methods of treating patients having disease using it.

BACKGROUND OF THE INVENTION

N-[4-(3-Amino-1H-indazol-4-yl)phenyl]-N'-(2-fluoro-5-methylphenyl)urea (ABT-869) belongs to a family of protein tyrosine kinases (PTKs) which catalyze the phosphorylation of specific tyrosine residues in cellular proteins. Aberrant or excessive PTK activity has been observed in many disease states including benign and malignant proliferative disorders and diseases resulting from inappropriate activation of the immune system.

Crystallinity of solvates of ABT-869 may effect, among other physical and mechanical properties, their stability, solubility, dissolution rate, hardness, compressibility and melting point. Because ease of manufacture and formulation of ABT-869 is dependent on some, if not all, of these properties, there is an existing need in the chemical and therapeutic arts for identification of crystalline forms of ABT-869 and ways to reproducibly make them.

Preparation of ABT-869 and its utility as a PTK inhibitor is described in commonly-owned United States Patent No. 7297709.

The following examples are presented to provide what is believed to be the most useful and readily understood description of procedures and conceptual aspects of this invention.

EXAMPLE 1

Preparation of ABT-869·¼ Ethanolate Crystalline Form 1

A mixture of ABT-869 hydrochloride in ethyl acetate and ethanol, in which the ABT-869 hydrochloride was completely soluble, was mixed with dibasic sodium phosphate. The organic layer was separated, treated with decolorizing carbon, and filtered. A small quantity of L-ascorbic acid was added, and the solution was concentrated. The ethyl acetate was removed by azeotropic distillation with ethanol. Additional ethanol may be added and the solution heated to dissolve any solid that forms. The solution was cooled to 25°C and diluted with water, causing ABT-869·¼ Ethanolate Crystalline Form 1 to crystallize. The product was isolated, washed with water, and dried under reduced pressure, while monitoring residual ethyl acetate and ethanol (by gas chromatography (GC)) and water (by Karl Fischer (KF)). A yield of 92% is typical.

Powder X-ray diffraction was performed using an XDS-2000/X-ray diffractometer equipped with a 2 kW normal focus X-ray tube and a Peltier cooled germanium solid-state detector (Scintag Inc., Sunnyvale, CA). The data were processed using DMSNT software (version 1.37). The X-ray source was a copper filament (Cu-Kα at 1.54178 Å) operated at 45 kV and 40 mA. The alignment of the goniometer was checked daily using a Corundum standard. The sample was placed in a thin layer (with no prior grinding) onto a zero background plate and continuously scanned at a rate of 2° 2θ per minute over a range of 2°-40° 2θ.

Figure 1 is a powder x-ray diffraction pattern of ABT-869·¼ Ethanolate Crystalline Form 1.

EXAMPLE 2

Preparation of ABT-869 Monohydrate Crystalline Form 1

Following the neutralization with dibasic sodium phosphate, decolorizing carbon treatment and the removal of ethyl acetate as described in EXAMPLE 1, the mixture of ABT-869 in ethanol was gradually mixed with water at 25°C, with vigorous agitation. ABT-869·H_2O Crystalline Form 1 was isolated, washed with water, and dried under reduced

pressure while monitoring residual ethyl acetate and ethanol (by GC) and water (by KF). The dried material may be delumped/milled to control particle size. A yield of 76% is typical.

Powder X-ray diffraction was performed using an XDS-2000/X-ray diffractometer equipped with a 2 kW normal focus X-ray tube and a Peltier cooled germanium solid-state detector (Scintag Inc., Sunnyvale, CA). The data were processed using DMSNT software (version 1.37). The X-ray source was a copper filament (Cu-Kα at 1.54178 Å) operated at 45 kV and 40 mA. The alignment of the goniometer was checked daily using a Corundum standard. The sample was placed in a thin layer (with no prior grinding) onto a zero background plate and continuously scanned at a rate of 2° 2θ per minute over a range of 2°-40° 2θ.

It is meant to be understood that relative intensities of peak heights in a PXRD pattern may vary and will be dependent on variables such as the temperature, size of crystal size or morphology, sample preparation, or sample height in the analysis well of the X-ray diffractometer.

It is also meant to be understood that peak positions may vary when measured with different radiation sources. For example, Cu-$K\alpha_1$, Mo-Kα, Co-Kα and Fe-Kα radiation, having wavelengths of 1.54060 Å, 0.7107 Å, 1.7902 Å and 1.9373 Å, respectively, may provide peak positions which differ from those measured with Cu-Kα radiation, which has a wavelength of 1.5478 Å.

The term "about" preceding a series of peak positions means that all of the peaks of the group which it precedes are reported in terms of angular positions (two theta) with an allowable variability of ± 0.1° as specified by the U.S. Pharmacopeia, pages 1843-1884 (1995). The variability of ± 0.1° is intended to be used when comparing two powder X-ray diffraction patterns. In practice, if a diffraction pattern peak from one pattern is assigned a range of angular positions (two theta) which is the measured peak position ± 0.1° and if those ranges of peak positions overlap, then the two peaks are considered to have the same angular position. For example, if a peak from one pattern is determined to have a position of 11.0°,

for comparison purposes the allowable variability allows the peak to be assigned a position in the range of 10.9.°-11.1°.

Accordingly, for example, the phrase "about 4.5°, 7.7°, 11.7°, 12.2°, 14.6°, 16.9°, 17.7° and 18.4°," as used herein, means about 4.5°, about 7.7°, about 11.7°, about 12.2°, about 14.6°, about 16.9°, about 17.7° and about 18.4° which, in turn, means 4.5° ± 0.1°, 7.7° ± 0.1°, 11.7° ± 0.1°, 12.2° ± 0.1°, 14.6° ± 0.1°, 16.9° ± 0.1°, 17.7° ± 0.1° and 18.4° ± 0.1°.

The term "about" preceding a temperature means the given temperature ± 2°C. For example, about 25°C means 25°C ± 2°C or 23°C-27°C.

The foregoing is meant to be illustrative of the invention and not intended to limit it to the disclosed embodiments. Variations and changes obvious to one skilled in the art are intended to be within the scope and nature of the invention as defined in the claims.
