

ABSTRACT

DEVICE AND METHOD FOR INTRODUCING A FILLING MATERIAL

The invention relates to a device for introducing a filling material into a hole in the ground, with a channel-like filling means which can be introduced into the hole and has an upper feed opening for feeding in the filling material and a lower discharge opening for discharging the filling material in a lower area of the hole. The filling means comprises an upper feed section and a flexible hose section arranged below. During the filling of the hole with the filling material the flexible hose section can be moved upwards along the feed section. During upward movement of the flexible hose section a severing means severs an upper area of the hose section in a longitudinal direction. Furthermore, the invention relates to a method for introducing a filling material into a hole.
