

DERIVATIVES OF 5-BENZYLISOQUINOLINE FOR THE TREATMENT OF CARDIOVASCULAR DISEASES

The present invention relates to new isoquinoline compounds, to their synthesis and to their use in the prevention and/or treatment of pathologies which are the result of activation of the RhoA/ROCK pathway and phosphorylation of the myosin light chain.

5 Under the effect of agonists such as angiotensin II, 5-hydroxytryptamine or endothelin, the RhoA membrane protein, which belongs to the family of the small GTP-binding proteins, acquires the active GTP-bound configuration, under the control of specific adenyl nucleotide exchange factors. This active membrane form permits binding to the Rho-kinase protein and activation thereof.

10 Rho-kinase is a serine/threonine kinase with a molecular mass of 160 kdaltons and one of the many targets of the RhoA protein. Two isoforms of Rho-kinase, Rho-kinase β /ROCK β /p160ROCK or ROCK1 and Rho-kinase α /ROCK α or ROCK2, which are coded for by two different genes, have been identified. The two isoforms are expressed ubiquitously, ROCK2 especially in the vascular smooth muscle cells, the heart and the brain. ROCK1 is
15 expressed preferentially on the non-nervous tissues such as the lungs, the liver, the spleen, the kidneys and the testicles. These two isoforms share 92% homology in their kinase domain. The activation of ROCK by RhoA-GTP leads to phosphorylation and inhibition of a myosin phosphatase regulatory subunit and thus allows the myosin light chain to be maintained in a phosphorylated state, independently of the intracellular Ca^{2+} concentration
20 (a process known as Ca^{2+} sensitisation). Phosphorylation of the myosin light chain is responsible for increasing the contractility of the actin cytoskeleton, which is the result of sliding between the actin and myosin filaments.

Activation of the RhoA/ROCK pathway is involved in the following dysfunctions and the pathologies associated therewith:

- 25
- vasoconstriction by increase of the myogenic tone (Rattan et al, Pharmacological Sciences, 880 :1-10, 2011),

***N*-[*(2,4-Difluorophenyl)methylidene*]-*(2S)*-2-methylpropane-2-sulphinamide**

Obtained by reaction of 2,4-difluorobenzaldehyde with *(S)*-(-)-2-methylpropane-2-sulphinamide according to **protocol XIV**

Intermediate 482 :

15 To a solution of *N*-[*(2,4-difluorophenyl)methylidene*]-*(2S)*-2-methylpropane-2-sulphinamide (5.1 g, 20 mmoles) in THF (30 mL), cooled to -60°C , there is added a solution of 2-(1,3-dioxolan-2-yl)ethyl-MgBr in methylene chloride (32 mL) prepared by reaction of magnesium (0.42 g) and 2-(2-bromoethyl)-1,3-dioxolane. The reaction mixture is stirred at -60°C for 20 minutes and is then hydrolysed at -40°C with a saturated aqueous

NH₄Cl solution. The mixture is decanted in the presence of ethyl ether, and the organic phase is washed with a saturated NaCl solution, dried over MgSO₄ and then concentrated. Chromatography on silica (eluant CH₂Cl₂/THF 95/5) yields 1.7 g of intermediate **482** in the form of an oil.

482

Intermediate 483 :

To a solution of intermediate **482** (5.2 g, 15 mmoles) in an EtOH/H₂O mixture (50 mL/50 mL) there are added trifluoroacetic acid (10 mL) and PtO₂ (0.5 g). The mixture is hydrogenated at atmospheric pressure and at ambient temperature for 22 hours. The catalyst is filtered off and the filtrate is concentrated. The residue is taken up in water and extracted with ethyl ether. The aqueous phase is brought to basic pH using a 10N NaOH solution. After extraction with ethyl ether, washing with a saturated aqueous NaCl solution and drying over MgSO₄, evaporation under reduced pressure yields intermediate **483** (2.2 g).

A solution of commercial 1-(3,5-difluorophenyl)ethanone (5 g, 32 mmol) and cyclohexanemethylamine (3.6 g, 32 mmol) in toluene (50 mL) is heated for 40 hours at reflux in an azeotropic assembly. The toluene is evaporated off and the residue is dissolved in ethanol (40 mL). The solution is cooled to 10°C, and then NaBH₄ (1.2 g, 32 mmol) is added in portions; the reaction mixture is stirred for 2 hours, and NaBH₄ (0.12 g) is again added. After stirring for 30 minutes, a 3N aqueous HCl solution is added carefully, and the ethanol is evaporated off *in vacuo*. The residue is taken up in toluene (200 mL) and washed with a 40% aqueous NaOH solution. The organic phase is dried over MgSO₄, and evaporation under reduced pressure yields intermediate **705** (4.4 g), which is used without additional treatment in the following step.

Obtained by oxidation of intermediate **229** resulting from the coupling of **228** and **125** according to the following protocol:

Step 1 :

500 mg (1.83 mmol) of 1,4-dibromo-2,5-difluorobenzene **228** are dissolved in 10 mL of anhydrous THF. The mixture is cooled to -50°C, under argon, and there is added dropwise 1 mL (2 mmol, 1.1 eq.) of a 2M solution in THF of isopropylmagnesium chloride. The temperature is maintained between -50°C and -40°C. Stirring is carried out for 30 minutes at -50°C, and the progress of the reaction is monitored by HPLC (approximately 75%). There is then added, still at -50°C, a solution of 0.37 g (1.83 mmol, 1 eq.) of **125** in 3 mL of anhydrous THF. The temperature is allowed to rise to -10°C. Monitoring of the reaction by HPLC shows the formation of 68% of the desired alcohol. Hydrolysis is carried out with 15 mL of 1N HCl. Extraction with 3 times 25 mL of ether is carried out, and the organic phase is washed with a saturated aqueous NaCl solution, dried over MgSO₄, filtered and evaporated to dryness. The residue obtained crystallises in dichloromethane. The solid is then filtered off and dried to give 280 mg of expected product in the form of a solid. The crystallisation liquors are evaporated to dryness and purified by flash chromatography on 40 g of silica, eluant : CH₂Cl₂-AcOEt gradient : 99-1 to 90-10 to give 200 mg of the purified intermediate.

¹H NMR (300 MHz, DMSO-d₆) : δ 8.45 (d, 1H), 8.10 (d, 1H), 7.90 (d, 1H), 7.70 (m, 2H), 7.55 (d, 1H, NH), 7.30 (d, 1H), 7.20 (d, 1H), 5.00 (quint, 1H), 4.60 (quad, 2H), 4.10 (t, 2H), 2.65 (m, 2H), 2.20 (s, 6H), 1.50 (t, 3H), 1.40 (broad s, 9H), 1.30 (d, 3H)

IR (cm⁻¹) : 3410, 1679, 1630, 1533, 1166

The ketone intermediates obtained by protocol **XX** were deprotected in an acidic medium to yield the final products, such as in the example of product **P110**:

Product P110 :

[4-(1-Aminoethyl)phenyl](isoquinolin-5-yl)methanone hydrochloride

To a solution of intermediate **591** (2.9 g, 7.7 mmol) in Et₂O (60 mL) there is added a solution of 2N HCl in ether (30 mL). The resulting suspension is stirred at ambient temperature for 4 days. The precipitate collected on a frit is dried *in vacuo*, and product **P110** is obtained in the form of a white solid (2.05 g).

The 1-ethoxyisoquinolin-5-yl ketone intermediates were then deprotected according to one of the two examples described below for **P17** and **P68**:

Product P17 :

[4-(1-Aminoethyl)-2,6-difluorophenyl](1-hydroxyisoquinolin-5-yl)methanone hydrochloride

A mixture of 11.86 g (36 mmol) of intermediate **127** in 710 mL of 4N HCl is heated at 80°C for 48h. After HPLC monitoring, the mixture is cooled to 0°C and the solid is filtered over a frit, which yields 8.2 g of product **P17** in the form of a white solid (1.1% of deamination product).

Product P68 :

5-{4-[(1R)-1-Aminoethyl]-2-methylbenzoyl}-3-methylisoquinolin-1(2H)-one methanesulphonate

A solution of intermediate **391** (0.7 g, 1.58 mmol) in a 1,4-dioxane/water mixture (14 mL/4 mL) and of methanesulphonic acid (0.51 mmol) is heated at 80°C for 24 hours. The reaction mixture is concentrated *in vacuo*, and the residue is taken up in CH₃CN. The resulting solid is filtered off and dried *in vacuo*. Product **P68** is obtained in the form of a solid.

Protocol XXI : Alternative method for the preparation of compounds of formula (I)
wherein X represents -C(=O)-

Compounds of formula (I) wherein X represents -C(=O)- can also be prepared by coupling reaction *via* directed ortho-metalation according to the example of the synthesis of intermediate **333** below:

Intermediate 332 :

***tert*-Butyl [(1*R*)-1-{3-[(1-ethoxyisoquinolin-5-yl)(hydroxy)methyl]-2,4-difluorophenyl}ethyl]carbamate**

To a solution of intermediate **331b** (35 g, 137 mmol) in THF (700 mL), cooled to -78°C under a nitrogen atmosphere, there is added a 2N solution of LDA in heptane/THF/ethylbenzene (170 mL, 342 mmol), the temperature being maintained below -75°C. The reaction mixture is stirred at -78°C for 30 minutes, and then a solution of intermediate **125** (28.8 g, 143 mmol) in THF (330 mL) is added in the course of 1 hour, the temperature being maintained below -75°C. The reaction mixture is stirred for 30 minutes. The reaction mixture is hydrolysed with water and then allowed to return to ambient temperature. The THF is removed under reduced pressure. The aqueous phase is extracted with 2 x 350 mL of AcOEt, and then the organic phases are combined and evaporated *in vacuo*. The residue is purified by flash chromatography on silica (eluant = CH₂Cl₂/AcOEt : 70/30). Intermediate **332** (56.3 g) is obtained in the form of a yellowish solid.

¹H NMR (400 MHz, DMSO-d₆) : δ 8.15 (m, 2H), 7.92 (d, 1H), 7.64 (t, 1H), 7.35 (m, 1H), 7.26 (m, 1H), 6.98 (m, 1H), 6.60 (s, 1H), 6.11 (broad s, 1H), 4.81 (m, 1H), 4.53 (quad, 2H), 1.42 (t, 3H), 1.38-1.22 (m, 12H), 1.35 (d, 3H).

***tert*-Butyl (1-{4-[(1-ethoxyisoquinolin-5-yl)carbonyl]-2-fluoro-3-methoxyphenyl}-ethyl)carbamate**

- 15 Intermediate **546** was obtained by nucleophilic substitution reaction (MeONa/DMF) starting from intermediate **271**: 4.8 g (10.5 mmol) of intermediate **271** are dissolved in 150 mL of DMF under a stream of nitrogen. 1.5 g (27.75 mmol, 2.6 eq.) of powdered sodium methoxide are added in a single batch. Stirring is carried out at ambient temperature overnight. HPLC monitoring after 16h at ambient temperature shows only
20 40% of product formed. A further 1.5 g (27.75 mmol, 2.6 eq.) of powdered sodium methoxide are added, and stirring is carried out for a further 6 hours. The mixture is hydrolysed by addition of ice-water. Extraction is carried out with 3 times 250 mL of ethyl acetate, and the organic phase is dried over MgSO₄ and then filtered and evaporated to dryness. 18 g of an oil still containing DMF are obtained. The residue is taken up in
25 200 mL of water and extracted with 5 times 200 mL of ether. The organic phase is dried over MgSO₄, filtered and evaporated to dryness. There are obtained 4.89 g of an orange oil, which is purified by flash chromatography on silica (eluant : CH₂Cl₂-AcOEt gradient: 99-1 to 90-10) to give 1.55 g of intermediate **546** in the form of a yellow meringue and 1.6 g of impure fractions.

Protocol XXII : Alternative method for the preparation of compounds of formula (I) wherein X represents -C(=O)

Compounds of formula (I) wherein X represents -C(=O) can also be prepared by coupling reaction by halogen-metal exchange of a halo-isoquinoline compound according to the example of the synthesis of intermediate **106** :

Intermediate 105 :

2,2,2-Trifluoro-N-(1-{3-fluoro-4-[hydroxy(isoquinolin-5-yl)methyl]-5-methoxy-phenyl}ethyl)acetamide

To a solution of intermediate **2** (1 g, 4.8 mmoles) in anhydrous THF (15 mL), under N₂ and cooled to -78°C, there is added a solution of *n*-BuLi (2.5N/hexane) (2.1 mL), the temperature being maintained below -70°C. The resulting solution is stirred for 20 minutes at -78°C, and then a solution of intermediate **104** (1.3 g, 4.4 mmoles) in anhydrous THF (15 mL) is added, the temperature being maintained below -70°C. The reaction mixture is stirred for 1 hour at -78°C and then for 1½ h at -50°C, and it is then hydrolysed and extracted with AcOEt. The organic phase is washed with water, dried over MgSO₄ and evaporated *in vacuo*. The residue is purified by flash chromatography on silica (eluant : CH₂Cl₂ / AcOEt : gradient : 100/0 to 90/10). Intermediate **105** (1 g) is obtained.

¹H NMR (300 MHz, DMSO-d₆) : δ 9.80 (broad s, 1H), 9.27 (s, 1H), 8.42 (d, 1H), 8.14 (broad d, 1H), 8.00 (d, 1H), 7.75 (d, 1H), 7.71 (t, 1H), 6.94 (broad s, 1H), 6.70 (broad d, 1H), 6.65 (dl, 1H), 5.98 (d, 1H), 4.97 (m, 1H), 3.93 (s, 3H), 1.41 (2d, 3H).

5 **Intermediate 106 :**

Intermediate 221 :

(4-Bromo-2-fluorophenyl)(1-ethoxyisoquinolin-5-yl)methanone

Step 1 :

To a solution of intermediate **124** (2 g, 7.94 mmol) in anhydrous THF (40 mL), cooled to -70°C, there is added, in the course of 20 minutes, a 2.5N solution of *n*-BuLi in hexane (3.2 mL, 8 mmol). The resulting solution is stirred for 10 minutes at -70°C, and then a solution of commercial 4-bromo-2-fluoro-benzaldehyde (1.66 g, 8.17 mmol) in THF (15 mL) is added in the course of 15 minutes. The reaction mixture is stirred at -70°C until the starting product has disappeared, and is hydrolysed with a saturated aqueous ammonium chloride solution. The organic phase is extracted with ethyl ether, washed with a saturated aqueous NaCl solution, dried over MgSO₄, filtered and evaporated *in vacuo*. By recrystallisation from acetonitrile, the expected intermediate (1.8 g) is obtained.

¹H NMR (400 MHz, DMSO-*d*₆) : δ 8.16 (d, 1H), 7.98 (d, 1H), 7.80 (d, 1H), 7.62 (t, 1H), 7.50 (d, 1H), 7.42 (d, 1H), 7.38 (m, 2H), 6.52 (d, 1H), 6.32 (d, OH), 4.50 (quad., 2H), 1.40 (t, 3H)

IR (cm⁻¹) : 3252, 1620-1602-1571, 1209-1163, 1038, 867-801-755

Step 2 :

Oxidation of the intermediate obtained above in the presence of MnO₂ yields intermediate **221**.

¹H NMR (400 MHz, DMSO-*d*₆) : δ 8.48 (d, 1H), 8.10 (d, 1H), 7.95 (d, 1H), 7.78 to 7.6 (m, 5H), 4.57 (quad, 2H), 1.45 (t, 3H)

IR (cm⁻¹) : 1650

Intermediate **223** was obtained starting from **221** :

Intermediate 222 :

4-[(1-Ethoxyisoquinolin-5-yl)carbonyl]-3-fluorobenzonitrile

To a solution of intermediate **221** (2 g, 5.34 mmol) in DMF (10 mL), degassed with nitrogen, at ambient temperature, there are added Zn(CN)₂ (0.75 g, 6.41 mmol) and Pd(PPh₃)₄ (0.31 g). The reaction mixture is heated at 100°C for 45 minutes and is then hydrolysed with water. The organic phase is extracted with ethyl acetate, washed 4 times with water and with a saturated aqueous NaCl solution, dried over MgSO₄, filtered and evaporated *in vacuo*. The residue is purified by flash chromatography on silica (eluant : CH₂Cl₂-AcOEt gradient: 100/0 to 95-5). The expected intermediate **222** (1.6 g) is obtained in the form of a solid.

¹H NMR (400 MHz, DMSO-d₆) : δ 8.51 (d, 1H), 8.17 (d, 1H), 8.08 (d, 1H), 7.99 (d, 1H), 7.94 (d, 1H), 7.89 (m, 2H), 7.70 (t, 1H), 4.58 (quad, 2H), 1.46 (t, 3H)

IR (cm⁻¹) : 1651, 2239

Intermediate 223 :

tert-Butyl {4-[(1-ethoxyisoquinolin-5-yl)carbonyl]-3-fluorobenzyl}carbamate

To a solution of intermediate **222** (250 mg, 0.78 mmol) in ethanol (5 mL) there are added di-tert-butyl dicarbonate (220 mg, 1.04 mmol) and Raney nickel (200 mg). The mixture is hydrogenated at atmospheric pressure and ambient temperature for 18 hours and then heated at 70°C for 2½ hours. After cooling, the catalyst is filtered off. The filtrate is evaporated to dryness and purified by flash chromatography on silica (eluant : CH₂Cl₂-AcOEt gradient: 99-1 to 90-10). Intermediate **223** (190 mg) is obtained.

Protocol XXIII : Alternative method for the preparation of compounds of formula (I) wherein X represents -C(=O)

Compounds of formula (I) wherein X represents -C(=O) can be prepared by aromatic electrophilic substitution reaction.

By way of example, the synthesis of intermediate **54** is described below:

Intermediate 54 :

2,2,2-Trifluoro-N-{1-[3-hydroxy-4-(isoquinolin-5-ylcarbonyl)-5-methylphenyl]ethyl}-acetamide

To a mixture of **53** (8.7 g, 33 mmol) and **655** (7.6 g, 33 mmol) in methylene chloride (700 mL) at 30°C there is added AlCl₃ (8.8 g). The mixture is heated for 1 hour at 50°C and then, after return to ambient temperature, AlCl₃ (8.8 g) is again added. The mixture is heated at 50°C for 24 hours, and AlCl₃ (8.8 g) is again added. After heating for 24 hours at 50°C and for two days at ambient temperature, the mixture is hydrolysed carefully on a mixture of ice and water. The product is extracted with methylene chloride, and the organic phase is dried and then concentrated *in vacuo*. The product is purified by chromatography on silica (eluant CH₂Cl₂/AcOEt 90/1). Intermediate **54** (3.8 g) is thus obtained.

¹H NMR (400 MHz, DMSO-d₆) : δ 9.50, 8.72, 8.70, 8.40, 7.90, 7.75, 6.80, 6.70, 4.97, 2.15, 1.50.

Protocol XXIV : Alternative method for the preparation of compounds of formula (I)
wherein X represents -C(=O)

Compounds of formula (I) wherein X represents -C(=O) can be prepared by reaction of boronic intermediates with carbonylated intermediates, the intermediate alcohol obtained is then oxidised to the ketone, and the protecting group of the amine function is removed.

By way of example, the synthesis of intermediate **569** is described below:

Intermediate 567 :

***tert*-Butyl {1-[2-fluoro-3-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)phenyl]ethyl}-carbamate**

To a mixture of intermediate **566** (2 g, 6.2 mmol), potassium acetate (1.2 g) and bis(pinacolato)diborane (1.75 g, 6.9 mmol) in 1,4-dioxane degassed with nitrogen (20 mL), there is added PdCl₂-dppf.CH₂Cl₂ (0.15 g, 3%). The reaction mixture is heated at reflux for 4 hours. After return to ambient temperature, the mixture is hydrolysed, and then toluene is added. After filtration, the filtrate is washed with water and a saturated aqueous NaCl solution; the organic phase is dried over MgSO₄ and concentrated. The residue is chromatographed on silica gel using an iPr₂O/cyclohexane eluant mixture (10/90 to 100/0). Intermediate **567** (1.9 g) is obtained in the form of an oil.

Pharmacological studies

ROCK1 enzymatic test

Evaluation of the effects of compounds on human ROCK1 activity quantified by measuring the phosphorylation of the substrate Ulight-RRRSLLE (PLK) using a human recombinant enzyme and the LANCE® detection method.

Experimental protocol

The test compound, the reference compound or water (control) is mixed with the enzyme (8.2 ng) in a buffer comprising 40 mM Hepes/Tris (pH 7.4), 0.8 mM EGTA/Tris, 8 mM MgCl₂, 1.6 mM DTT and 0.008% Tween 20.

The reaction is then started by adding 50 nM of Ulight-RRRSLLE (PLK) substrate and 1 µM of ATP, and the mixture is incubated for 30 minutes at ambient temperature. For the basal control measurements, the enzyme is excluded from the reaction mixture.

After the incubation, the reaction is stopped by adding 13 mM of EDTA. After 5 minutes, the anti-phospho-PLK antibody labelled with europium chelate is added. After a further 60 minutes, the fluorescence transfer is measured at $\lambda_{ex}=337$ nm, $\lambda_{em}=620$ nm and $\lambda_{em}=665$ nm using a microplate reader (Envision, Perkin Elmer). The enzymatic activity is determined by dividing the signal measured at 665 nm by that measured at 620 nm (ratio).

The results are expressed in the form of a percentage inhibition of the control enzymatic activity. The standard reference inhibition compound is staurosporine, which is tested in each experiment at several concentrations in order to obtain an inhibition curve on the basis of which the value of the IC₅₀ (concentration that induces 50% inhibition) is calculated.

Functional test (rat aorta)

Study of vascular reactivity on aortic segments of the rat.

After anaesthesia of the animal, the thoracic aorta is removed and immediately placed in a physiological saline solution (PSS). The proximal thoracic aorta is cleaned of adherent conjunctive tissue and 4 aortic rings (3-4 mm) are cut. The endothelium is removed mechanically without damaging the smooth muscle cells.

The rings without endothelium are placed in PSS medium in isolated organ baths maintained at 37°C in the presence of carbogen. The isometric tension of the rings is recorded by means of a force sensor. At their optimum tension, the rings are subjected to an equilibration period during which the physiological medium is replaced regularly.

The preparations are then contracted twice by means of a hyperpotassic solution (KCl 60 mM), each of the 2 contractions being followed by successive washings in order to return to the original tension. The absence of endothelium is verified after contraction by an α_1 -adrenergic receptor agonist, phenylephrine (PHE, 10^{-6} M), followed by the addition of carbachol (10^{-5} M), a muscarinic receptor agonist, which induces a relaxation only in the presence of endothelium. The rings are then washed regularly with PSS for 60 minutes in order to remove the pharmacological agents.

The rings are recontracted with PHE (10^{-6} M) and then, after stabilisation of the contraction, the product or its solvent is added in cumulative concentrations, 5 concentrations are tested: 10^{-8} M, 10^{-7} M, 10^{-6} M, 10^{-5} M and 3×10^{-5} M (if the product is dissolved in DMSO) or 10^{-4} M (if H₂O is the solvent of the product).

Analysis of the results

The contractile response is obtained in milligrams (mg). The results are expressed by the mean $\pm$ SEM of the contractile responses obtained on at least 2 rats. The variations in tension of each product are calculated as a percentage of the maximum contraction induced by PHE before the product is added, *according to the formula*:

$$\% \text{ contraction } B(t) = [x \text{ (mg) tension (compound) } B(t) / y \text{ (mg) maximum tension (PHE) } B] \times 100.$$

The concentration-response curves obtained are analysed and allow the IC₅₀ value of each product to be determined (IC₅₀: concentration of product necessary to inhibit 50% of the maximum contraction induced by PHE), the estimation of the IC₅₀ value of the concentration-response curves being obtained by non-linear regression.

Evaluation on the arterial pressure (SHR rats)

The effect of the ROCK inhibitors was tested by the reduction of the arterial pressure (AP) that they induce in spontaneously hypertensive rats (SHR) after intravenous (i.v.) and/or oral administration. In summary, the SHRs were anaesthetised with 2% isoflurane, and a telemetry probe (PAC40, Data Science International) was implanted in the abdominal aorta to record the AP and a polyethylene catheter was implanted in the jugular vein for the i.v. administration.

After recovery from the surgery (2 to 3 weeks), the AP was recorded continuously for 24 hours after administration of the ROCK inhibitors at doses of 1, 3, 10 and 30 mg/kg by the i.v. route and/or by the oral route. The effect on the AP was expressed as the percentage reduction relative to the basal arterial pressure before administration of the product.
