

System for preparing a brewed product**Abstract**

The invention relates to a system for preparing a brewed product, comprising a portion capsule containing an extraction material, and an extraction appliance for preparing the brewed product from the extraction material contained in the portion capsule, wherein the extraction appliance comprises an injection device for introducing a brewing liquid into the portion capsule and an extraction device for driving an extraction product out of the portion capsule, wherein the injection device and the extraction device define between them an accommodation space for the portion capsule and can be moved away from one another in order to insert the capsule into the accommodation space and can be moved toward one another in order to fix the capsule in place. The extraction device has a pressure means, by which a wall of the portion capsule inserted in the accommodation space, which wall faces toward the extraction device, can be pressed in toward the capsule interior in order to compact the extraction material contained in the portion capsule before the injection device introduces brewing liquid into the portion capsule.
