

ABSTRACT

Provided is an information display device (100) that transmits and receives data (D_0) to and from other information display devices (100). The information display device (100) is provided with: a display panel (11) that displays information; and a plurality of optical communication modules (16) that transmit and receive the data (D_0), which includes the information to be displayed on the display panel (11), in a wireless manner using light. The optical communication modules (16) include a first optical communication module (16) directed in the first direction and a second optical communication module (16) directed in a different direction from the first direction. The data (D_0) received by the first optical communication module (16) is transmitted from the second optical communication module (16).
