(54) Title: MID-SERVICE SHARING

(57) **Abstract:** An approach is provided for mid-service sharing and includes selecting an icon in a display on an apparatus. The icon represents an application, such as a network resource, in a particular state of interaction with the apparatus. Sending a message is initiated. The message specifies icon data for presenting the icon within a different user device. According to another embodiment, an approach includes receiving a message that specifies state data for a first user device to access a network resource in a state of interaction with a second user device. A media stream is transmitted to the first user device. The media stream is synchronized with a media stream being transmitted to the second user device. In some embodiments, once a collaborative session is evoked, the action of either user augments the state presented on other user's device, for the duration of the joint action.
