METHODS AND SYSTEMS USING CONTACTLESS CARD

ABSTRACT

It is desirable to implement security features that can prevent the unauthorized use of a customer's sensitive account information from an RFID sticker. The methods and systems described herein attempt to resolve the deficiencies with the conventional RFID stickers. In a more secure implementation, a financial institution allows a customer to activate or deactivate the account for use with the RFID sticker by submitting a request to the financial institution using internet banking, mobile banking, SMS texting, or other communications method.
