

ABSTRACT**Floor Leveling Device**

5 The present invention provides a floor leveling device and frame member combination device (100). The floor leveling device and frame member combination device (100) comprises a longitudinal framing member with supporting plate (102) having a planar surface for supporting at least two floor leveling device (104a, 104b) in abutting position to the longitudinal framing member (102). Each floor leveling device
10 (104a, 104b) comprises a bracket fixture (106a, 106b) that is clasped to the longitudinal framing member (102) in abutting position. A threaded bolt and a first nut is positioned into a floor supporting member through a second nut to link a single column pole (120a, 120b) of the floor leveling device to the frame member (102). The floor supporting member of the floor leveling device (104a, 104b) sets floor panels into required levels by
15 adjusting the level of the threaded bolt (108a, 108b).
