

ABSTRACT

APPARATUS EVALUATION SYSTEM AND APPARATUS EVALUATION METHOD

5 Provided is an apparatus evaluation system and an apparatus evaluation method that
enable accurate evaluation of an air conditioning apparatus. An apparatus evaluation system
(200) evaluates, among a first air conditioning apparatus (100A) and a second air conditioning
apparatus (100B) that perform air conditioning of a first space, at least the first air conditioning
apparatus (100A). The apparatus evaluation system includes an evaluation unit (212) that
evaluates the first air conditioning apparatus, and an air conditioning control unit (214) that
10 controls the second air conditioning apparatus. The evaluation unit performs a first evaluation
process for evaluating the first air conditioning apparatus based on a first evaluation index
obtained in a first operation as a first evaluation operation performed at a time of installation
of the first air conditioning apparatus, and a second evaluation process for evaluating the first
air conditioning apparatus based on the first evaluation index obtained in a second operation
15 as the first evaluation operation performed after the first evaluation process. The air
conditioning control unit operates the second air conditioning apparatus before at least one of
the first operation and the second operation is performed and/or while at least one of the first
operation and the second operation is being performed.
