

ABSTRACT

STATE ANALYZER SYSTEM AND STATE ANALYSIS DEVICE

5 Provided is a state analysis device and a state analyzer system that include a
specific state determination unit configured to determine specific state information
representing a state of refrigerant at a specific position in a refrigeration circuit and a
normal region determination unit configured to determine a normal region in a state
space within which the specific state information is present when an air-conditioning
10 apparatus operates under a normal state. The state analysis device and the state
analyzer system allow a display unit to display the specific state information and the
normal region.
