

The Abstract (Summary of Invention)

162162

The Odourless System is a system, which eliminates unpleasant odour in the toilet during excretion by a powerful air extraction unit which sucks the unpleasant odour from within the toilet bowl and discharges it to a more appropriate location such as the atmosphere either through a ventilation opening or common WC vent. Drawing number MT-DWG-OS-001 explains how it works. It is unlike the traditional exhaust fan concept where an exhaust fan is fitted at the ventilation opening of a toilet since the traditional configuration allows the odour to rise out of the toilet bowl and passes by the person's nostril before being displaced outside the toilet space.

The inventor of the Odourless System is very excited with this product and is convinced that the world will learn to love it and eventually be a standard feature in all toilets as the world continue to seek higher living standard.
