

SYSTEM AND METHOD FOR PROVIDING INSTANT QUERY

ABSTRACT

[0034] An information technology system provided for an instant query includes a dispatcher, a data processor and a storage system. The dispatcher receives data streams from multiple machines and transmits the data streams to a network storage device. In addition, the dispatcher creates a copy of the data streams and transmits the copy to the data processor. The data processor processes the copy according to a predetermined rule to generate an output. The output transmitted to and stored in the storage system is provided for an application to perform the instant query via an interface of the information technology system.
