

Abstract

Fluid flow control device

A fluid flow control device is engagable with a fluid outlet. The device has a flow
5 regulator movable within the device against a first bias between a first position
allowing fluid flow from the fluid outlet through the device at a first flow rate for a
particular fluid pressure and a second position allowing fluid flow from the fluid
outlet through the device at a second flow rate for the same fluid pressure. The
second flow rate is greater than the first flow rate. Upon user selection of the
10 second position, the device is movable to the second position under fluid
pressure force through the device if the fluid pressure force exceeds a first bias
threshold, and resets to the first flow regulator position when the fluid pressure
force is less than the first bias threshold.
