(54) Title: CONTROL SYSTEM ARRANGEMENTS AND METHODS FOR DISPARATE NETWORK SYSTEMS

(57) Abstract: Electronic transaction data sets are processed for a multitude of disparate transactions using a plurality autonomous payment networks. A software-programmed computer type system receives and processes point-of-sale transaction data to select one of the payment networks associated with a participant ID (e.g., for a buyer or seller) in the transaction data. The system includes a plurality of network-specific interface modules, each associated with a specific payment network for interfacing therewith. For point-of-sale transaction data, the interface module corresponding to the selected payment network communicates payment data to the selected payment network to effect electronic payment for the point-of-sale transaction data.
