

VALVE

ABSTRACT

Valve (1) with an opening (3) surrounded by a valve seat (2), and a closure member (4), wherein, in a closed position, the closure member (4) is pressed onto the valve seat (2) and closes the opening (3) and, in an intermediate position, is raised from the valve seat (2) and overlaps with the opening (3) and, in a maximum opening position, at least partially releases the opening (3), wherein the valve (1) has at least one first valve drive (5) for moving the closure member (4) between the maximum opening position and the intermediate position along a first movement track (6), and at least one second valve drive (7) for moving the closure member (4) between the intermediate position and the closed position along a second movement track (8) which is at an angle to the first movement track (6), wherein the valve (1) has at least one transmission part (9) which is provided for reversible deformation by means of the second valve drive (7), and the first valve drive (5) acts on the closure member (4) with the interposition of the transmission part (9).
