

ABSTRACT

TABLE GAME MANAGEMENT SYSTEM AND GAME MANAGEMENT SYSTEM

The management and control device (50) uses the information acquired from the measurement device (21) to detect a total bet amount (B) of the chips (9) placed on the bet area of the game table (4) by the game participants, and uses the information acquired from the card shoe (3) and the measurement device (21) to detect a winning or losing amount (Y) for the game organizer. A sales balance management part (611) compares a sales profit ratio (X) that is a ratio of the winning or losing amount (Y) for the game organizer to the total bet amount (B) with a theoretical profit ratio or a previous average profit ratio, and outputs a comparison result.
