

ABSTRACT

A method for controlling a virtual object, and a related apparatus. The method comprises: displaying a user interface, wherein the user interface comprises a rocker control for controlling a virtual object to move (301); receiving a quick click operation signal acting on a target area corresponding to the rocker control (302); and controlling, according to the quick click operation signal, the virtual object to automatically run in a virtual scene displayed on the user interface (303). By means of displaying a rocker control in a user interface, and controlling a virtual object to automatically run in a virtual environment displayed on the user interface when a quick click operation signal acting on a target area corresponding to the rocker control is received, the method realizes the function of triggering, by means of one key, the virtual object to automatically run, without continuous clicking or continuous pressing of a certain operation control by a user, thereby improving the operation efficiency.
