

ABSTRACT

PROXY APPARATUS, ANALYSIS APPARATUS, REFERENCE APPARATUS, AND METHOD, PROGRAM,
AND SYSTEM EXECUTED THEREBY

A proxy apparatus includes: a request determination unit 105 which receives a request transmitted from a virtual browser and determines a security risk of a request URL specified in the request; a request transfer unit 101 which transfers the request for which it is determined by the request determination unit 105 that the request URL is normal, to a server 30 operating an analysis target site, the analysis target site being a target site for which a service used at the analysis target site is identified; a response analysis unit 102 which receives and analyzes a response from the server 30; and a response return unit 103 which returns the response to the virtual browser. Accordingly, it is possible to prevent the analysis apparatus 10 from receiving a response having a security risk.
