

Direction Control Device, Direction Control Method And Recording Medium

Abstract

The present invention enables a wearer to set the image capturing direction of a camera to a predetermined direction when wearing a terminal with the camera. A direction control device is provided with: a camera unit that acquires a captured image obtained by capturing an image of a subject by a camera; an image processing unit that calculates the position of a first setting image indicating the subject within the captured image; a pose detection unit that detects a difference between the position of a second setting image indicating the subject within a pre-registered reference image and the position of the first setting image; and a camera control unit that moves the image capturing direction of the camera on the basis of the difference.
