WHAT IS CLAIMED IS:

1. An IC card, comprising:

an IC module; and

a substrate in which the IC module is buried;

wherein the IC module includes

a memory section to store information showing a file structure; and

a control section to

receive a first command,

transmit a first response containing information showing a file structure in response to reception of the first command,

receive a second command which is transmitted in response to the first response, and which includes a first data searched from the information showing the file structure, and

set up the first data to the IC module itself in response to reception of the second ~~data~~ command.

2. The IC card according to claim ~~2~~1, ~~,~~ wherein the control section sets up the first data and change a present state into an issue completion state.

3. The IC card according to claim 1, wherein

the control section

transmits the first response containing the information showing the file structure which includes a first identification information and a first length, and

receives the second command containing the first identification information and the first data which is searched based on the first identification information.

4. The IC card according to claim 3, wherein the control section set up the first data contained in the second command based on the first identification information contained in the second command.

5. The IC card according to claim 1, wherein the control section

transmits the first response containing information showing the file structure which contains a first identification information, a first length, a second identification information and a second length,

receives a second command containing the first identification information and the first data searched based on the first identification information, and

receives a third command containing the second identification information and the second data searched based on the second identification information.

6. The IC card according to claim 5, wherein the control section

sets up the first data contained in the second command based on the first identification information contained in the second command, and

sets up the second data contained in the third command based on the second identification information contained in the third command.

7. The IC card according to claim 6, wherein the control section ~~the control section~~ sets up the second data and changes a present state into an issue completion state.

8. An information processing method comprising:

receiving a first command;

transmitting a first response containing information showing a file structure in response to reception of the first command;

receiving a second command which is transmitted in response to the first response, and which includes a first data searched from the information showing the file structure; and

setting up the first data in response to reception of the second command.

9. A computer readable recording medium which stores a program that makes a computer perform process comprising steps of:

transmitting a first command;

receiving a first response containing information showing a file structure in response to transmission of the first command,

searching the first data based on the information showing the file structure, and

transmitting a second command containing the first data.

10. A program which makes a computer perform process comprising steps of:

transmitting a first command;

receiving a first response containing information showing a file structure in response to transmission of the first command;

searching the first data based on the information showing the file structure; and

transmitting a second command containing the first data.
