(54) Title: CONTROL CONFIGURATION PRIORITY FOR NETWORK-CONTROLLED REPEATERS

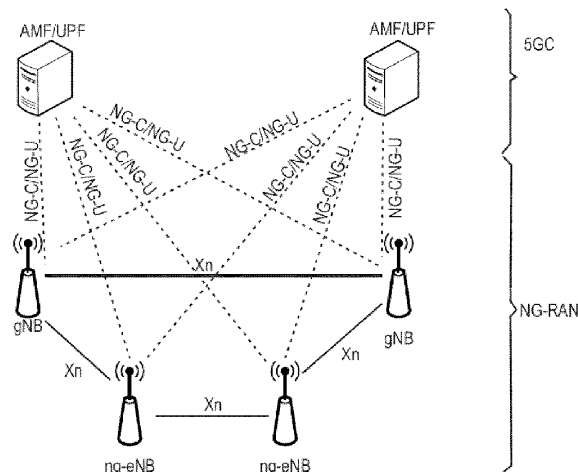

Fig. 1

(57) Abstract: The present disclosure relates to a communication device, a scheduling device and respective methods for a communication device and a scheduling device. For example, the communication device comprises a transceiver and circuitry. The transceiver, in operation: (i) receives signals to be relayed and transmits the received signals, (ii) transmits or receives control signals, and (iii) receives relay configuration signalling. The circuitry, in operation, (i) obtains, from the relay configuration signalling, a plurality of relay configurations, wherein each relay configuration is to be applied to the signals, which are transmitted or received by the communication device, and (ii) determines, for a time interval, where two or more relay configurations overlap, to apply a relay configuration among the two or more overlapping relay configurations to the signals, which are transmitted or received by the communication device, wherein the circuitry, in operation, determines, for the time interval, to apply the relay configuration, which has a highest priority among the two or more overlapping relay configurations.
