

ABSTRACT OF THE DISCLOSURE

CLAMPING ASSEMBLY FOR POSITIONING A MESHED MEMBER TO BE TESTED

A clamping assembly includes a base having a first side from which a top member extends, a plurality of separating members are fixedly connected a second side of the base, and a plate is removably connected to the separating members by bolts with a meshed member fixedly disposed between the separating members and the board. The top member has a first bolt hole defined therein for being connected to a movable part of a testing machine.
