

ABSTRACT OF THE DISCLOSURE

SYSTEM AND METHOD FOR FACILITATING SIGNING PROCESS

A system includes a client-end device, a first service-end device, and a platform communicating with the devices establishing a connection between the devices. The platform enables the first service-end device to display a document menu including a document name related to an electronic document, and an option set corresponding to the document name. The platform enables each of the client-end device and the first service-end device to display a split screen including a video region and an unsigned-document region. The platform controls each of the client-end device and the first service-end device to display a signature box on the split screen, and enables each of the client-end device and the first service-end device to display a stroke of a signature in the signature box, where an image of the signature is to be superposed on a signature field of the electronic document.

Fig. 1 is suggested for publication.
