[ABSTRACT]

A congestion information display system includes: a sensor device that includes a housing which has a plurality of surfaces associated with congestion information indicating a congestion status of a facility, and an acceleration sensor configured to acquire an acceleration changed in accordance with a change in an orientation of the housing by a user's operation; a detection unit configured to detect a surface facing a predetermined direction among the plurality of surfaces based on the acceleration acquired by the acceleration sensor; a congestion information acquisition unit configured to acquire the congestion information associated with the surface detected by the detection unit; and a display processing unit configured to display, on a display device, the congestion information acquired by the congestion information acquisition unit.
