

ABSTRACT

A beverage preparation system is provided. The beverage preparation system may include a web-based server, a user interface, and multiple beverage preparation modules. Each beverage preparation module may have a different function and may talk to the user interface via the digital signals through one or more communication protocols. The beverage preparation modules may be added or removed from the system at any time. The web-based server may store recipes for preparing beverages. Each recipe may include the sequential steps in which a corresponding beverage is to be made. In some embodiments, the user interface may upload the usage record of the system to the web-based server.
