

ABSTRACT

The present invention relates to a method, a system, and a non-transitory computer-readable recording medium for providing a medical service. According to an aspect of the present invention, a method for providing a medical service is provided, the method comprising the steps of: determining whether a patient carrying a patient device enters a hospital, by making reference to information on the location of the patient device; acquiring information on a medical appointment for the patient or the patient's electronic medical record (EMR) when it is determined that the patient has entered the hospital; and setting a medical resource deployment policy personalized to the patient, by making reference to the acquired information on the medical appointment or EMR.
