

METHOD FOR ESTABLISHING TUNNEL FOR TASK AND APPARATUS

ABSTRACT

A method for establishing a tunnel for a task and an apparatus are provided. The method
5 includes: A TFF receives a first request message from a TCF, where the first request message is
used to request the TFF to establish a tunnel for a first task. The TFF sends, to the TCF, a first
response message in response to the first request message, where the first response message
includes tunnel information of the TFF associated with the first task. The TFF receives, from the
TCF, tunnel information of an access network device associated with the first task. According to
10 the design, a tunnel for a task may be established between the access network device and the TFF,
and at least one terminal and/or at least one TPF participating in the task may share the tunnel for
the task and exchange task data, thereby simplifying complexity of the access network device and
the TPF.
