A blockchain is maintained by a number (N) of nodes, wherein one of the nodes acts as a primary node and the other (N-1) nodes act as backup nodes, and the method is performed by one of the N nodes

511: detecting a change in a current height H of the blockchain

512: determining the primary node based on a parameter P and the number of nodes N, wherein the parameter P is proportional to the current height H of the blockchain

513: in response to determining that the one of the N nodes is the primary node, executing a PBFT normal operation protocol as the primary node

514: in response to determining that the one of the N nodes is not the primary node, executing the PBFT normal operation protocol as one of the backup nodes

515: repeating the steps 511-514 for one or more rounds of the execution of the PBFT normal operation protocol; and for each of the one or more rounds, changing the primary node based on the parameter P and the number of nodes
