

ABSTRACT

Color development occurring in a packaging material having a heat-sensitive color-developing layer during heat sealing of the packaging material is suppressed.

- 5 The packaging material (31) has a base material (32) and a heat-sensitive color-developing layer (34) stacked on the base material (32). An accommodation portion forming unit (7) has a heating member (71) and a receiving member (72) disposed to face the heating member (71). In the packaging material (31) that is being conveyed through the accommodation portion forming unit (7), the heat-sensitive color-
- 10 developing layer (34) is positioned farther away from the heating member (71) than the base material (32).
