

ABSTRACT

EXTENSION ELEMENT FOR A MOVABLE BRIDGE

Extension element for extending a movable bridge (1), inclined drive-on ramps (4) being arranged in the end regions (3) of said bridge. In order to widen the use spectrum even of bridges (1) which are already in use, the extension element (5) can be releasably coupled to the end regions (3) of the bridge (1) via a coupling region (7), thereby making it possible to extend the bridge (1) in a simple and cost-effective manner. The invention further relates to a movable bridge, to a bridge-laying vehicle and to a method for extending a movable bridge (1).
