

[ABSTRACT]

In a side draft type range hood with a straightening plate, more oily smoke is caught by improving the suction performance, and the caught oil is collected to an oil receiver.

Provided is a range hood 100 which includes: an inner face panel 20 provided at an inner face of a hood 10 and having an opening part 22 through which air is sucked; and a straightening plate 30 opposed to the inner face panel and attached to cover the opening part, and in which, in a mounted state, a first end 20U of the inner face panel and a first end 30U of the straightening plate corresponding to the first end of the inner face panel are respectively in higher positions than a second end 20D of the inner face panel and a second end 30D of the straightening plate corresponding to the second end of the inner face panel. This range hood further includes: an air volume suppressing part 21 which reduces the space between the straightening plate and the inner face panel partly on a second end side; and an oil receiving part 40 provided on a second end side of the straightening plate or on a second end side of the inner face panel and having a greater width than a width of the second end of the straightening plate.
