

ABSTRACT

Machine for the working of tubes provided with a device for detecting any slippage of the tube being worked

5

The machine (100) comprises a working apparatus (10, 14, 16) arranged to carry out the working operation on a tube (T), or a similar blank, and a tube feeding device (22) arranged to feed the tube (T) towards the working apparatus (10, 14, 16). The working apparatus (10, 14, 16) and the tube feeding device (22) comprise respective clamping members (14) for clamping the tube (T) being worked. According to the invention, at least one of the clamping members (14) of the working apparatus (10, 14, 16) or of the tube feeding device (22) is provided with a displacement sensor (24) arranged to detect and measure any movements of the tube (T) relative to said clamping member (14) while the tube (T) is clamped by said clamping member (14) during the working operation.
