

## **PASSENGER BOARDING BRIDGE**

### **ABSTRACT**

Provided is a passenger boarding bridge which has a stepless structure and allows a walkway section of an outer tunnel to be stably supported. The passenger boarding bridge comprises: a walkway section (22) which is provided at an outer tunnel of adjacent tunnels, and is movable between a walkway position set at a predetermined height position and a non-walkway position located under the walkway position; and a plurality of rotary members (50) arranged along the lengthwise direction of the outer tunnel, each of the plurality of rotary members being rotatable around a rotation axis line extending in a vertical direction, and each of the plurality of rotary members being configured to be rotated between a first rotation position at which the rotary member supports an end portion of the walkway section in a width direction so that the walkway section is at the walkway position and a second rotation position at which the rotary member is away from the end portion of the walkway section in the width direction and does not support the end portion of the walkway section in the width direction, wherein in a case where at least one of adjacent rotary members of the plurality of rotary members is at the second rotation position, the adjacent rotary members partially overlap with each other when viewed in the width direction of the walkway section or in the vertical direction.
