[0049] In reference to compounds herein, unless clearly indicated to the contrary, specification of a compound or group of compounds includes pharmaceutically acceptable salts of such compound(s), pharmaceutically acceptable formulations of such compound(s), prodrug(s), and all stereoisomers thereof. In reference to compositions, kits, methods of use, etc. of compounds of Formula I described herein, it is understood (unless indicated otherwise) that a compound of Formula I includes all sub-embodiments thereof (e.g. including Formula Ia, Ib, Ic, Id, Ie, If, Ig, Ih, Ii, and Ij and all embodiments as described above).

[0050] In one aspect, methods are provided for treating a protein kinase mediated disease or condition in an animal subject, wherein the method involves administering to the subject an effective amount of one or more compound(s) of Formula I. The terms "treat," "therapy," and like terms refer to the administration of material, e.g., one or more compound(s) of Formula I, in an amount effective to prevent, alleviate, or ameliorate one or more symptoms of a disease or condition, i.e., indication, and/or to prolong the survival of the subject being treated. The term "protein kinase mediated disease or condition" refers to a disease or condition in which the biological function of a protein kinase affects the development, and/or course, and/or symptoms of the disease or condition, and/or in which modulation of the protein kinase alters the development, course, and/or symptoms of the disease or condition. A protein kinase mediated disease or condition includes a disease or condition for which modulation provides a therapeutic benefit, e.g. wherein treatment with protein kinase modulators, including compounds described herein, provides a therapeutic benefit to the subject suffering from or at risk of the disease or condition. In one aspect, the protein kinase modulator is an inhibitor of the protein kinase. In one aspect, the method involves administering to the subject an effective amount of one or more compound(s) of Formula I in combination with one or more other therapies for the disease or condition.

[0051] In one aspect, methods are provided for treating a protein kinase mediated disease or condition in an animal subject, wherein the method involves administering to the subject an effective amount of any one or more compound(s) of Formula I.

[0052] In one aspect, the invention provides methods for treating a Raf protein kinase mediated disease or condition in an animal subject, wherein the method involves administering to the subject an effective amount of one or more compound(s) of Formula I. The terms "Raf protein kinase mediated disease or condition," "Raf mediated disease or condition," and the like refer to a disease or condition in which the biological function of a Raf kinase, including any mutations thereof, affects the development, course, and/or symptoms of the disease or condition, and/or in which modulation of the Raf protein kinase alters the development, course, and/or symptoms of the disease or condition. The Raf protein kinase includes, but is not limited to, A-Raf, mutations of A-Raf, B-Raf, mutations of B-Raf, c-Raf-1 and mutations of c-Raf-1. In some embodiments, the Raf protein kinase is B-Raf mutation V600E. In some embodiments, the Raf protein kinase is B-Raf mutation V600E/T529I. In some embodiments, the disease or condition is a cancer that is amenable to treatment by an inhibitor of the V600E mutant B-Raf. In some embodiments, the disease or condition is a cancer that is amenable to treatment by an inhibitor of the V600E/T529I mutant B-Raf. The Raf protein kinase mediated disease or condition includes a disease or condition for which Raf modulation provides a therapeutic benefit, e.g. wherein treatment with Raf modulators, including compounds described herein, provides a therapeutic benefit to the subject suffering from or at risk of the disease or condition. In one aspect, the Raf modulator is a Raf inhibitor. In one aspect, the method involves administering to the subject an effective amount of a compound of Formula I in combination with one or more other therapies for the disease or condition. [0097] As used herein, the term "composition" refers to a formulation suitable for administration to an intended animal subject for therapeutic purposes that contains at least one pharmaceutically active compound and at least one pharmaceutically acceptable carrier or excipient.

[0098] The term "pharmaceutically acceptable" indicates that the indicated material does not have properties that would cause a reasonably prudent medical practitioner to avoid administration of the material to a patient, taking into consideration the disease or conditions to be treated and the respective route of administration. For example, it is commonly required that such a material be essentially sterile, e.g., for injectibles.

[0099] In the present context, the term "therapeutically effective" or "effective amount" indicates that the materials or amount of material is effective to prevent, alleviate, or ameliorate one or more symptoms of a disease or medical condition, and/or to prolong the survival of the subject being treated.

[0100] In the present context, the terms "synergistically effective" or "synergistic effect" indicate that two or more compounds that are therapeutically effective, when used in combination, provide improved therapeutic effects greater than the additive effect that would be expected based on the effect of each compound used by itself.

[0101] As used herein, the terms "ligand" and "modulator" are used equivalently to refer to a compound that changes (i.e., increases or decreases) the activity of a target biomolecule, *e.g.*, an enzyme such as a kinase. The term "inhibitor" refers to a modulator that decreases the activity of the target biomolecule. Generally a ligand or modulator will be a small molecule, where "small molecule refers to a compound with a molecular weight of 1500 daltons or less, or preferably 1000 daltons or less, 800 daltons or less, or 600 daltons or less.

[0102] In the context of compounds binding to a target, the terms "greater affinity" and "selective" indicates that the compound binds more tightly than a reference compound, or than the same compound in a reference condition, *i.e.*, with a lower dissociation constant. In some embodiments, the greater affinity (i.e. selectivity) is at least 2, 3, 4, 5, 8, 10, 50, 100, 200, 400, 500, 1000, or 10,000-fold greater affinity.

[0103] As used herein in connection with compounds of the invention, the term "synthesizing" and like terms means chemical synthesis from one or more precursor materials.

[0104] By "assaying" is meant the creation of experimental conditions and the gathering of data regarding a particular result of the experimental conditions. For example, enzymes can be assayed based on their ability to act upon a detectable substrate. A compound or ligand can be assayed based on its ability to bind to a particular target molecule or molecules.

[0105] As used herein, the term "modulating" or "modulate" refers to an effect of altering a biological activity, especially a biological activity associated with a particular biomolecule such as a protein kinase. For example, an agonist or antagonist of a particular biomolecule modulates the activity of that biomolecule, *e.g.*, an enzyme, by either increasing (e.g. agonist, activator), or decreasing (e.g. antagonist, inhibitor) the activity of the biomolecule, such as an enzyme. Such activity is typically indicated in terms of an inhibitory concentration (IC_{50}) or excitation concentration (EC_{50}) of the compound for an inhibitor or activator, respectively, with respect to, for example, an enzyme.

[0106] In the context of the use, testing, or screening of compounds that are or may be modulators, the term "contacting" means that the compound(s) are caused to be in sufficient proximity to a particular molecule, complex, cell, tissue, organism, or other specified material that potential binding interactions and/or chemical reaction between the compound and other specified material can occur.

[0107] As used herein in connection with amino acid or nucleic acid sequence, the term "isolate" indicates that the sequence is separated from at least a portion of the amino acid and/or nucleic acid sequences with which it would normally be associated.

[0108] In connection with amino acid or nucleic sequences, the term "purified" indicates that the subject molecule constitutes a significantly greater proportion of the biomolecules in a composition than the proportion observed in a prior composition, e.g., in a cell culture. The greater proportion can be 2-fold, 5-fold, 10-fold, or more than 10-fold, with respect to the proportion found in the prior composition.

[0109] The present invention concerns compounds of Formula I, and all sub-generic formulae, that are modulators of protein kinases, for example without limitation, the compounds are modulators of at least one of the kinases selected from the group consisting of Abl, Akt1, Akt2, Akt3, ALK, Alk5, A-Raf, B-Raf, Brk, Btk, Cdk2, CDK4, CDK5, CDK6, CHK1, c-Raf-1, Csk, EGFR, EphA1, EphA2, EphB2, EphB4, Erk2, Fak, FGFR1, FGFR2, FGFR3, FGFR4, Flt1, Flt3, Flt4, Fms, Frk, Fyn, Gsk3α, Gsk3β, HCK, Her2/Erbb2, Her4/Erbb4, IGF1R, IKK beta, Irak4, Itk, Jak1, Jak2, Jak3, Jnk1, Jnk2, Jnk3, Kdr, Kit, Lck, Lyn, MAP2K1, MAP2K2, MAP4K4, MAPKAPK2, Met, Mnk1, MLK1, p38, PDGFRA, PDGFRB, PDPK1, Pim1, Pim2, Pim3, PKC alpha, PKC beta, PKC theta, Plk1, Pyk2, Ret, ROCK1, ROCK2, Ron, Src, Stk6, Syk, TEC, Tie2, TrkA, TrkB, Yes, and Zap70, and any mutations thereof, and the use of such compounds in the treatment of diseases or conditions.

Kinase targets and indications of the invention

[0110] Protein kinases play key roles in propagating biochemical signals in diverse biological pathways. More than 500 kinases have been described, and specific kinases have been implicated in a wide range of diseases or conditions (i.e., indications), including for example without limitation, cancer, cardiovascular disease, inflammatory disease, neurological disease, and other diseases. As such, kinases represent important control points for small molecule therapeutic intervention. Specific target protein kinases contemplated by the present invention are described in the art, including, without limitation, protein kinases as described in US Patent Application Serial number 11/473,347 (see also, PCT publication WO2007002433), the disclosure of which is hereby incorporated by reference in its entirety, including all specifications, figures, and tables, and for all purposes, as well as the following:

[0111] A-Raf: Target kinase A-Raf (i.e., v-raf murine sarcoma 3611 viral oncogene homolog 1) is a 67.6 kDa serine/threonine kinase encoded by chromosome Xp11.4-p11.2 (symbol: ARAF). The mature protein comprises RBD (i.e., Ras binding domain) and phorbol-ester/DAG-type zinc finger domain and is involved in the transduction of mitogenic signals from the cell membrane to the nucleus. A-Raf inhibitors may be useful in treating neurologic diseases such as multi-infarct dementia, head injury, spinal cord injury, Alzheimer's disease (AD), Parkinson's disease; neoplastic diseases including, but not limited to, melanoma, glioma, sarcoma, carcinoma (e.g. colorectal, lung, breast, pancreatic, thyroid, renal, ovarian), lymphoma (e.g. histiocytic lymphoma), neurofibromatosis, myelodysplastic syndrome, leukemia, tumor angiogenesis; pain of neuropathic or inflammatory origin, including acute pain, chronic pain, cancer-related pain and migraine; and diseases associated with muscle regeneration or degeneration, including, but not limited to, vascular restenosis, sarcopenia, muscular dystrophies (including, but not limited to, Duchenne, Becker, Emery-Dreifuss, Limb-Girdle, Facioscapulohumeral, Myotonic, Oculopharyngeal, Distal and Congenital Muscular Dystrophies), motor neuron diseases (including, but not limited to, amyotrophic lateral sclerosis, infantile progressive spinal muscular atrophy, intermediate spinal muscular atrophy, juvenile spinal muscular atrophy, spinal bulbar muscular atrophy, and adult spinal muscular atrophy), inflammatory myopathies (including, but not limited to, dermatomyositis, polymyositis, and inclusion body myositis), diseases of the neuromuscular junction (including, but not limited to, myasthenia gravis, Lambert-Eaton syndrome, and congenital myasthenic syndrome), myopathies due to endocrine abnormalities (including, but not limited to, hyperthyroid myopathy and hypothyroid myopathy) diseases of peripheral nerve (including, but not limited to, Charcot-Marie-Tooth disease, Dejerine-Sottas disease, and Friedreich's ataxia), other myopathies (including, but not limited to, myotonia congenita, paramyotonia congenita, central core disease, nemaline myopathy, myotubular myopathy, and periodic paralysis), and metabolic diseases of muscle (including, but not limited to, phosphorylase deficiency, acid maltase deficiency, phosphofructokinase deficiency, debrancher enzyme deficiency, mitochondrial myopathy, carnitine deficiency, carnitine palmatyl transferase deficiency, phosphoglycerate kinase deficiency, phosphoglycerate mutase deficiency, lactate dehydrogenase deficiency, and myoadenylate deaminase deficiency).

[0112] B-Raf: Target kinase B-Raf (i.e., v-raf murine sarcoma viral oncogene homolog B1) is a 84.4 kDa serine/threonine kinase encoded by chromosome 7q34 (symbol: BRAF). The mature protein comprises RBD (i.e., Ras binding domain), C1 (i.e., protein kinase C conserved region 1) and STK (i.e., serine/threonine kinase) domains.

[0113] Target kinase B-Raf is involved in the transduction of mitogenic signals from the cell membrane to the nucleus and may play a role in the postsynaptic responses of hippocampal neurons. As such, genes of the RAF family encode kinases that are regulated by Ras and mediate cellular

responses to growth signals. Indeed, B-Raf kinase is a key component of the RAS->Raf-> MEK->ERK/MAP kinase signaling pathway, which plays a fundamental role in the regulation of cell growth, division and proliferation, and, when constitutively activated, causes tumorigenesis. Among several isoforms of Raf kinase, the B-type, or B-Raf, is the strongest activator of the downstream MAP kinase signaling.

[0114] The BRAF gene is frequently mutated in a variety of human tumors, especially in malignant melanoma and colon carcinoma. The most common reported mutation was a missense thymine (T) to adenine (A) transversion at nucleotide 1796 (T1796A; amino acid change in the B-Raf protein is Val<600> to Glu<600>) observed in 80% of malignant melanoma tumors. Functional analysis reveals that this transversion is the only detected mutation that causes constitutive activation of B-Raf kinase activity, independent of RAS activation, by converting B-Raf into a dominant transforming protein. Based on precedents, human tumors develop resistance to kinase inhibitors by mutating a specific amino acid in the catalytic domain as the "gatekeeper". (Balak, et. al., Clin Cancer Res. 2006, 12:6494-501). Mutation of Thr-529 in BRAF to Ile is thus anticipated as a mechanism of resistance to BRAF inhibitors, and this can be envisioned as a transition in codon 529 from ACC to ATC.

[0115] Niihori et al., report that in 43 individuals with cardio-facio-cutaneous (CFC) syndrome, they identified two heterozygous KRAS mutations in three individuals and eight BRAF mutations in 16 individuals, suggesting that dysregulation of the RAS-RAF-ERK pathway is a common molecular basis for the three related disorders (Niihori et al., Nat Genet. 2006, 38(3):294-6).

[0116] c-Raf-1: Target kinase c-Raf-1 (i.e., v-raf murine sarcoma viral oncogene homolog 1) is a 73.0 kDa STK encoded by chromosome 3p25 (symbol: RAF1). c-Raf-1 can be targeted to to the mitochondria by BCL2 (i.e., oncogene B-cell leukemia 2) which is a regulator of apoptotic cell death. Active c-Raf-1 improves BCL2-mediated resistance to apoptosis, and c-Raf-1 phosphorylates BAD (i.e., BCL2-binding protein). c-Raf-1 is implicated in carcinomas, including colorectal, ovarian, lung and renal cell carcinoma. C-Raf-1 is also implicated as an important mediator of tumor angiogenesis (Hood, J.D. et al., 2002, Science **296**, 2404). C-Raf-1 inhibitors may also be useful for the treatment of acute myeloid leukemia and myelodysplastic syndromes (Crump, Curr Pharm Des 2002, 8(25):2243-8). Raf-1 activators may be useful as treatment for neuroendocrine tumors, such as medullary thyroid cancer, carcinoid, small cell lung cancer and pheochromocytoma (Kunnimalaiyaan et al., Anticancer Drugs 2006, 17(2):139-42).

[0117] Raf inhibitors (A-Raf and/or B-Raf and/or c-Raf-1) may be useful in treating A-Raf-mediated, B-Raf-mediated or c-Raf-1-mediated disease or condition selected from the group consisting of neurologic diseases, including, but not limited to, multi-infarct dementia, head injury, spinal cord injury, Alzheimer's disease (AD), Parkinson's disease; neoplastic diseases including, but

not limited to, melanoma, glioma, sarcoma, carcinoma (e.g. colorectal, lung, breast, pancreatic, thyroid, renal, ovarian), lymphoma (e.g. histiocytic lymphoma) neurofibromatosis, acute myeloid leukemia, myelodysplastic syndrome, leukemia, tumor angiogenesis, neuroendocrine tumors such as medullary thyroid cancer, carcinoid, small cell lung cancer and pheochromocytoma; pain of neuropathic or inflammatory origin, including, but not limited to, acute pain, chronic pain, cancer-related pain, and migraine; cardiovascular diseases, including, but not limited to, heart failure, ischemic stroke, cardiac hypertrophy, thrombosis (e.g. thrombotic microangiopathy syndromes), atherosclerosis, and reperfusion injury; inflammation including, but not limited to, psoriasis, arthritis and autoimmune diseases and conditions, osteoarthritis, endometriosis, scarring, vascular restenosis, fibrotic disorders, rheumatoid arthritis, inflammatory bowel disease (IBD); immunodeficiency diseases, including, but not limited to, organ transplant rejection, graft versus host disease; renal or prostatic diseases, including, but not limited to, diabetic nephropathy, polycystic kidney disease, nephrosclerosis, glomerulonephritis, prostate hyperplasia; metabolic disorders, including, but not limited to, obesity; infection, including, but not limited to, *Helicobacter pylori, Hepatitis* and *Influenza* viruses, fever, and sepsis; pulmonary diseases, including, but not limited to, chronic obstructive pulmonary disease (COPD) and acute respiratory distress syndrome (ARDS); genetic developmental diseases, including, but not limited to, Noonan's syndrome, Costello syndrome, (faciocutaneoskeletal syndrome), LEOPARD syndrome, cardio-faciocutaneous syndrome (CFC), and neural crest syndrome abnormalities causing cardiovascular, skeletal, intestinal, skin, hair and endocrine diseases.

Kinase Activity Assays

[0118] A number of different assays for kinase activity can be utilized for assaying for active modulators and/or determining specificity of a modulator for a particular kinase or group or kinases. In addition to the assay mentioned in the Examples below, one of ordinary skill in the art will know of other assays that can be utilized and can modify an assay for a particular application. For example, numerous papers concerning kinases describe assays that can be used.

[0119] Additional alternative assays can employ binding determinations. For example, this sort of assay can be formatted either in a fluorescence resonance energy transfer (FRET) format, or using an AlphaScreen (*a*mplified *l*uminescent *p*roximity *h*omogeneous *a*ssay) format by varying the donor and acceptor reagents that are attached to streptavidin or the phosphor-specific antibody.

Organic Synthetic Techniques

[0120] A wide array of organic synthetic techniques exist in the art to facilitate the construction of potential modulators. Many of these organic synthetic methods are described in detail in standard

reference sources utilized by those skilled in the art. One example of such a reference is March, 1994, Advanced Organic Chemistry: Reactions, Mechanisms and Structure, New York, McGraw Hill. Thus, the techniques useful to synthesize a potential modulator of kinase function are readily available to those skilled in the art of organic chemical synthesis.

(a) Prodrugs and Metabolites

[0122] In addition to the present formulae and compounds described herein, the invention also includes prodrugs (generally pharmaceutically acceptable prodrugs), active metabolic derivatives (active metabolites), and their pharmaceutically acceptable salts.

[0123] Prodrugs are compounds or pharmaceutically acceptable salts thereof which, when metabolized under physiological conditions or when converted by solvolysis, yield the desired active compound. Prodrugs include, without limitation, esters, amides, carbamates, carbonates, ureides, solvates, or hydrates of the active compound. Typically, the prodrug is inactive, or less active than the active compound, but may provide one or more advantageous handling, administration, and/or metabolic properties. For example, some prodrugs are esters of the active compound; during metabolysis, the ester group is cleaved to yield the active drug. Esters include, for example, esters of a carboxylic acid group, or S-acyl or O-acyl derivatives of thiol, alcohol, or phenol groups. In this context, a common example is an alkyl ester of a carboxylic acid. Some prodrugs are activated enzymatically to yield the active compound, or a compound which, upon further chemical reaction, yields the active compound. Prodrugs may proceed from prodrug form to active form in a single step or may have one or more intermediate forms which may themselves have activity or may be inactive.

[0124] As described in *The Practice of Medicinal Chemistry*, Ch. 31-32 (Ed. Wermuth, Academic Press, San Diego, CA, 2001), prodrugs can be conceptually divided into two non-exclusive categories, bioprecursor prodrugs and carrier prodrugs. Generally, bioprecursor prodrugs are compounds that are inactive or have low activity compared to the corresponding active drug compound, that contain one or more protective groups and are converted to an active form by metabolism or solvolysis. Both the

active drug form and any released metabolic products should have acceptably low toxicity. Typically, the formation of active drug compound involves a metabolic process or reaction that is one of the follow types:

[0125] Oxidative reactions: Oxidative reactions are exemplified without limitation to reactions such as oxidation of alcohol, carbonyl, and acid functionalities, hydroxylation of aliphatic carbons, hydroxylation of alicyclic carbon atoms, oxidation of aromatic carbon atoms, oxidation of carbon-carbon double bonds, oxidation of nitrogen-containing functional groups, oxidation of silicon, phosphorus, arsenic, and sulfur, oxidative N-dealkylation, oxidative O- and S-dealkylation, oxidative deamination, as well as other oxidative reactions.

[0126] Reductive reactions: Reductive reactions are exemplified without limitation to reactions such as reduction of carbonyl functionalitites, reduction of alcohol functionalities and carbon-carbon double bonds, reduction of nitrogen-containing functional groups, and other reduction reactions.

[0127] Reactions without change in the oxidation state: Reactions without change in the state of oxidation are exemplified without limitation to reactions such as hydrolysis of esters and ethers, hydrolytic cleavage of carbon-nitrogen single bonds, hydrolytic cleavage of non-aromatic heterocycles, hydration and dehydration at multiple bonds, new atomic linkages resulting from dehydration reactions, hydrolytic dehalogenation, removal of hydrogen halide molecule, and other such reactions.

[0128] Carrier prodrugs are drug compounds that contain a transport moiety, e.g., that improves uptake and/or localized delivery to a site(s) of action. Desirably for such a carrier prodrug, the linkage between the drug moiety and the transport moiety is a covalent bond, the prodrug is inactive or less active than the drug compound, the prodrug and any release transport moiety are acceptably non-toxic. For prodrugs where the transport moiety is intended to enhance uptake, typically the release of the transport moiety should be rapid. In other cases, it is desirable to utilize a moiety that provides slow release, e.g., certain polymers or other moieties, such as cyclodextrins. (See, e.g., Cheng et al., U.S. Patent Publ. No. 20040077595, App. No. 10/656,838, incorporated herein by reference.) Such carrier prodrugs are often advantageous for orally administered drugs. In some instances, the transport moiety provides targeted delivery of the drug, for example the drug maybe conjugated to an antibody or antibody fragment. Carrier prodrugs can, for example, be used to improve one or more of the following properties: increased lipophilicity, increased duration of pharmacological effects, increased site-specificity, decreased toxicity and adverse reactions, and/or improvement in drug formulation (e.g., stability, water solubility, suppression of an undesirable organoleptic or physiochemical property). For example, lipophilicity can be increased by

esterification of hydroxyl groups with lipophilic carboxylic acids, or of carboxylic acid groups with alcohols, e.g., aliphatic alcohols. Wermuth, *supra*.

[0129] Metabolites, e.g., active metabolites, overlap with prodrugs as described above, e.g., bioprecursor prodrugs. Thus, such metabolites are pharmacologically active compounds or compounds that further metabolize to pharmacologically active compounds that are derivatives resulting from metabolic processes in the body of a subject. Of these, active metabolites are such pharmacologically active derivative compounds. For prodrugs, the prodrug compound is generally inactive or of lower activity than the metabolic product. For active metabolites, the parent compound may be either an active compound or may be an inactive prodrug. For example, in some compounds, one or more alkoxy groups can be metabolized to hydroxyl groups while retaining pharmacologic activity and/or carboxyl groups can be esterified, e.g., glucuronidation. In some cases, there can be more than one metabolite, where an intermediate metabolite(s) is further metabolized to provide an active metabolite. For example, in some cases a derivative compound resulting from metabolic glucuronidation may be inactive or of low activity, and can be further metabolized to provide an active metabolite.

[0130] Metabolites of a compound may be identified using routine techniques known in the art, and their activities determined using tests such as those described herein. See, e.g., Bertolini et al., 1997, *J. Med. Chem.*, 40:2011-2016; Shan et al., 1997, *J Pharm Sci* 86(7):756-757; Bagshawe, 1995, *Drug Dev. Res.*, 34:220-230; Wermuth, *supra*.

(b) Tautomers, Stereoisomers, and Regioisomers

[0131] It is understood that some compounds may exhibit tautomerism. In such cases, the formulae provided herein expressly depict only one of the possible tautomeric forms. It is therefore to be understood that the formulae provided herein are intended to represent any tautomeric form of the depicted compounds and are not to be limited merely to the specific tautomeric form depicted by the drawings of the formulae.

[0132] Likewise, some of the compounds according to the present invention may exist as stereoisomers, i.e. having the same atomic connectivity of covalently bonded atoms yet differing in the spatial orientation of the atoms. For example, compounds may be optical stereoisomers, which contain one or more chiral centers, and therefore, may exist in two or more stereoisomeric forms (e.g. enantiomers or diastereomers). Thus, such compounds may be present as single stereoisomers (i.e., essentially free of other stereoisomers), racemates, and/or mixtures of enantiomers and/or diastereomers. As another example, stereoisomers include geometric isomers, such as *cis*- or *trans*-orientation of substituents on adjacent carbons of a double bond. All such single stereoisomers,

racemates and mixtures thereof are intended to be within the scope of the present invention. Unless specified to the contrary, all such steroisomeric forms are included within the formulae provided herein.

[0133] In some embodiments, a chiral compound of the present invention is in a form that contains at least 80% of a single isomer (60% enantiomeric excess ("e.e.") or diastereomeric excess ("d.e.")), or at least 85% (70% e.e. or d.e.), 90% (80% e.e. or d.e.), 95% (90% e.e. or d.e.), 97.5% (95% e.e. or d.e.), or 99% (98% e.e. or d.e.). As generally understood by those skilled in the art, an optically pure compound having one chiral center is one that consists essentially of one of the two possible enantiomers (i.e., is enantiomerically pure), and an optically pure compound having more than one chiral center is one that is both diastereomerically pure and enantiomerically pure. In some embodiments, the compound is present in optically pure form, such optically pure form being prepared and/or isolated by methods known in the art (e.g. by recrystallization techniques, chiral synthetic techniques (including synthesis from optically pure starting materials), and chromatographic separation using a chiral column.

(c) Pharmaceutically acceptable salts and formulations

[0134] Unless specified to the contrary, specification of a compound herein includes pharmaceutically acceptable salts of such compound. Thus, compounds of Formula I can be in the form of pharmaceutically acceptable salts, or can be formulated as pharmaceutically acceptable salts. Contemplated pharmaceutically acceptable salt forms include, without limitation, mono, bis, tris, tetrakis, and so on. Pharmaceutically acceptable salts are non-toxic in the amounts and concentrations at which they are administered. The preparation of such salts can facilitate the pharmacological use by altering the physical characteristics of a compound without preventing it from exerting its physiological effect. Useful alterations in physical properties include lowering the melting point to facilitate transmucosal administration and increasing the solubility to facilitate administering higher concentrations of the drug. A compound of the invention may possess a sufficiently acidic, a sufficiently basic, or both functional groups, and accordingly react with any of a number of inorganic or organic bases, and inorganic and organic acids, to form a pharmaceutically acceptable salt.

[0135] Pharmaceutically acceptable salts include acid addition salts such as those containing chloride, bromide, iodide, hydrochloride, acetate, phenylacetate, acrylate, ascorbate, aspartate, benzoate, 2-phenoxybenzoate, 2-acetoxybenzoate, dinitrobenzoate, hydroxybenzoate, methoxybenzoate, methylbenzoate, bicarbonate, butyne-1,4 dioate, hexyne-1,6-dioate, caproate, caprylate, chlorobenzoate, cinnamate, citrate, decanoate, formate, fumarate, glycolate, gluconate, glucarate, glucuronate, glucose-6-phosphate, glutamate, heptanoate, hexanoate, isethionate, isobutyrate, gamma-hydroxybutyrate, phenylbutyrate, lactate, malate, maleate, hydroxymaleate,

methylmaleate, malonate, mandelate, nicotinate, nitrate, isonicotinate, octanoate, oleate, oxalate, pamoate, phosphate, monohydrogenphosphate, dihydrogenphosphate, orthophosphate, metaphosphate, pyrophosphate, 2-phosphoglycerate, 3-phosphoglycerate, phthalate, propionate, phenylpropionate, propiolate, pyruvate, quinate, salicylate, 4-aminosalicylate, sebacate, stearate, suberate, succinate, sulfate, pyrosulfate, bisulfate, sulfite, bisulfite, sulfamate, sulfonate, benzenesulfonate (i.e. besylate), ethanesulfonate (i.e. esylate), ethane-1,2-disulfonate, 2-hydroxyethanesulfonate (i.e. isethionate), methanesulfonate (i.e. mesylate), naphthalene-1-sulfonate, naphthalene-2-sulfonate (i.e. napsylate), propanesulfonate, *p*-toluenesulfonate (i.e. tosylate), xylenesulfonates, cyclohexylsulfamate, tartrate, and trifluoroacetate. These pharmaceutically acceptable acid addition salts can be prepared using the appropriate corresponding acid.

[0136] When acidic functional groups, such as carboxylic acid or phenol are present, pharmaceutically acceptable salts also include basic addition salts such as those containing benzathine, chloroprocaine, choline, ethanolamine, diethanolamine, triethanolamine, t-butylamine, dicyclohexylamine, ethylenediamine, N,N'-dibenzylethylenediamine, meglumine, hydroxyethylpyrrolidine, piperidine, morpholine, piperazine, procaine, aluminum, calcium, copper, iron, lithium, magnesium, manganese, potassium, sodium, zinc, ammonium, and mono-, di-, or tri-alkylamines, or salts derived from amino acids such as L-histidine, L-glycine, L-lysine, and L-arginine. For example, see *Remington's Pharmaceutical Sciences*, 19th ed., Mack Publishing Co., Easton, PA, Vol. 2, p. 1457, 1995. These pharmaceutically acceptable base addition salts can be prepared using the appropriate corresponding base.

[0137] Pharmaceutically acceptable salts can be prepared by standard techniques. For example, the free-base form of a compound can be dissolved in a suitable solvent, such as an aqueous or aqueous-alcohol solution containing the appropriate acid and then isolated by evaporating the solution. In another example, a salt can be prepared by reacting the free base and acid in an organic solvent. If the particular compound is an acid, the desired pharmaceutically acceptable salt may be prepared by any suitable method, for example, treatment of the free acid with an appropriate inorganic or organic base.

[0138] The pharmaceutically acceptable salt of the different compounds may be present as a complex. Examples of complexes include 8-chlorotheophylline complex (analogous to, *e.g.*, dimenhydrinate: diphenhydramine 8-chlorotheophylline (1:1) complex; Dramamine) and various cyclodextrin inclusion complexes.

(d) Other compound forms

[0139] In the case of agents that are solids, it is understood by those skilled in the art that the compounds and salts may exist in different crystal or polymorphic forms, or may be formulated as co-crystals, or may be in an amorphous form, or may be any combination thereof (e.g. partially crystalline, partially amorphous, or mixtures of polymorphs) all of which are intended to be within the scope of the present invention and specified formulae. Whereas salts are formed by acid/base addition, i.e. a free base or free acid of the compound of interest forms an acid/base reaction with a corresponding addition base or addition acid, respectively, resulting in an ionic charge interaction, co-crystals are a new chemical species that is formed between neutral compounds, resulting in the compound and an additional molecular species in the same crystal structure.

[0140] Additionally, the formulae are intended to cover hydrated or solvated as well as unhydrated or unsolvated forms of the identified structures. For example, the indicated structures include both hydrated and non-hydrated forms. Other examples of solvates include the structures in combination with a suitable solvent, such as isopropanol, ethanol, methanol, dimethylsulfoxide, ethyl acetate, acetic acid, or ethanolamine.

Administration

[0141] The methods and compounds will typically be used in therapy for human subjects. However, they may also be used to treat similar or identical indications in other animal subjects. Compounds of Formula I can be administered by different routes, including injection (i.e. parenteral, including intravenous, intraperitoneal, subcutaneous, and intramuscular), oral, transdermal, transmucosal, rectal, or inhalant. Such dosage forms should allow the compound to reach target cells. Other factors are well known in the art, and include considerations such as toxicity and dosage forms that retard the compound or composition from exerting its effects. Techniques and formulations generally may be found in Remington: *The Science and Practice of Pharmacy*, 21st edition, Lippincott, Williams and Wilkins, Philadelphia, PA, 2005 (hereby incorporated by reference herein).

[0142] In some embodiments, compositions will comprise carriers or excipients, which may be chosen to facilitate administration of the compound by a particular route. Examples of carriers include calcium carbonate, calcium phosphate, various sugars such as lactose, glucose, or sucrose, types of starch, cellulose derivatives, gelatin, lipids, liposomes, nanoparticles, and the like. Carriers also include physiologically compatible liquids as solvents or for suspensions, including, for example, sterile solutions of water for injection (WFI), saline solution, dextrose solution, Hank's solution, Ringer's solution, vegetable oils, mineral oils, animal oils, polyethylene glycols, liquid paraffin, and the like.

[0143] In some embodiments, oral administration may be used. Pharmaceutical preparations for oral use can be formulated into conventional oral dosage forms such as capsules, tablets, and liquid preparations such as syrups, elixirs, and concentrated drops. Compounds of Formula I may be combined with solid excipients, optionally grinding a resulting mixture, and processing the mixture of granules, after adding suitable auxiliaries, if desired, to obtain, for example, tablets, coated tablets, hard capsules, soft capsules, solutions (e.g. aqueous, alcoholic, or oily solutions) and the like. Suitable excipients are, in particular, fillers such as sugars, including lactose, glucose, sucrose, mannitol, or sorbitol; cellulose preparations, for example, corn starch, wheat starch, rice starch, potato starch, gelatin, gum tragacanth, methyl cellulose, hydroxypropylmethyl-cellulose, sodium carboxymethylcellulose (CMC), and/or polyvinylpyrrolidone (PVP: povidone); oily excipients, including vegetable and animal oils, such as sunflower oil, olive oil, or codliver oil. The oral dosage formulations may also contain disintegrating agents, such as the cross-linked polyvinylpyrrolidone, agar, or alginic acid, or a salt thereof such as sodium alginate; a lubricant, such as talc or magnesium stearate; a plasticizer, such as glycerol or sorbitol; a sweetening such as sucrose, fructose, lactose, or aspartame; a natural or artificial flavoring agent, such as peppermint, oil of wintergreen, or cherry flavoring; or dye-stuffs or pigments, which may be used for identification or characterization of different doses or combinations. Also provided are dragee cores with suitable coatings. For this purpose, concentrated sugar solutions may be used, which may optionally contain, for example, gum arabic, talc, poly-vinylpyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents or solvent mixtures.

[0144] Pharmaceutical preparations that can be used orally include push-fit capsules made of gelatin ("gelcaps"), as well as soft, sealed capsules made of gelatin, and a plasticizer, such as glycerol or sorbitol. The push-fit capsules can contain the active ingredients in admixture with filler such as lactose, binders such as starches, and/or lubricants such as talc or magnesium stearate and, optionally, stabilizers. In soft capsules, the active compounds may be dissolved or suspended in suitable liquids, such as fatty oils, liquid paraffin, or liquid polyethylene glycols.

[0145] In some embodiments, injection (parenteral administration) may be used, *e.g.*, intramuscular, intravenous, intraperitoneal, and/or subcutaneous. Compounds of Formula I for injection may be formulated in sterile liquid solutions, preferably in physiologically compatible buffers or solutions, such as saline solution, Hank's solution, or Ringer's solution. Dispersions may also be prepared in non-aqueous solutions, such as glycerol, propylene glycol, ethanol, liquid polyethylene glycols, triacetin, and vegetable oils. Solutions may also contain a preservative, such as methylparaben, propylparaben, chlorobutanol, phenol, sorbic acid, thimerosal, and the like. In addition, the compounds may be formulated in solid form, including, for example, lyophilized forms, and redissolved or suspended prior to use.

[0146] In some embodiments, transmucosal, topical or transdermal administration may be used. In such formulations of compounds of Formula I, penetrants appropriate to the barrier to be permeated are used. Such penetrants are generally known in the art, and include, for example, for transmucosal administration, bile salts and fusidic acid derivatives. In addition, detergents may be used to facilitate permeation. Transmucosal administration, for example, may be through nasal sprays or suppositories (rectal or vaginal). Compositions of compounds of Formula I for topical administration may be formulated as oils, creams, lotions, ointments, and the like by choice of appropriate carriers known in the art. Suitable carriers include vegetable or mineral oils, white petrolatum (white soft paraffin), branched chain fats or oils, animal fats and high molecular weight alcohol (greater than C_{12}). In some embodiments, carriers are selected such that the active ingredient is soluble. Emulsifiers, stabilizers, humectants and antioxidants may also be included as well as agents imparting color or fragrance, if desired. Creams for topical application are preferably formulated from a mixture of mineral oil, self-emulsifying beeswax and water in which mixture the active ingredient, dissolved in a small amount of solvent (e.g., an oil), is admixed. Additionally, administration by transdermal means may comprise a transdermal patch or dressing such as a bandage impregnated with an active ingredient and optionally one or more carriers or diluents known in the art. To be administered in the form of a transdermal delivery system, the dosage administration will be continuous rather than intermittent throughout the dosage regimen.

[0147] In some embodiments, compounds are administered as inhalants. Compounds of Formula I may be formulated as dry powder or a suitable solution, suspension, or aerosol. Powders and solutions may be formulated with suitable additives known in the art. For example, powders may include a suitable powder base such as lactose or starch, and solutions may comprise propylene glycol, sterile water, ethanol, sodium chloride and other additives, such as acid, alkali and buffer salts. Such solutions or suspensions may be administered by inhaling via spray, pump, atomizer, or nebulizer, and the like. The compounds of Formula I may also be used in combination with other inhaled therapies, for example corticosteroids such as fluticasone proprionate, beclomethasone dipropionate, triamcinolone acetonide, budesonide, and mometasone furoate; beta agonists such as albuterol, salmeterol, and formoterol; anticholinergic agents such as ipratroprium bromide or tiotropium; vasodilators such as treprostinal and iloprost; enzymes such as DNAase; therapeutic proteins; immunoglobulin antibodies; an oligonucleotide, such as single or double stranded DNA or RNA, siRNA; antibiotics such as tobramycin; muscarinic receptor antagonists; leukotriene antagonists; cytokine antagonists; protease inhibitors; cromolyn sodium; nedocril sodium; and sodium cromoglycate.

[0148] The amounts of various compounds to be administered can be determined by standard procedures taking into account factors such as the compound activity (*in vitro*, e.g. the compound IC_{50}

vs. target, or *in vivo* activity in animal efficacy models), pharmacokinetic results in animal models (e.g. biological half-life or bioavailability), the age, size, and weight of the subject, and the disorder associated with the subject. The importance of these and other factors are well known to those of ordinary skill in the art. Generally, a dose will be in the range of about 0.01 to 50 mg/kg, also about 0.1 to 20 mg/kg of the subject being treated. Multiple doses may be used.

[0149] The compounds of Formula I may also be used in combination with other therapies for treating the same disease. Such combination use includes administration of the compounds and one or more other therapeutics at different times, or co-administration of the compound and one or more other therapies. In some embodiments, dosage may be modified for one or more of the compounds of the invention or other therapeutics used in combination, e.g., reduction in the amount dosed relative to a compound or therapy used alone, by methods well known to those of ordinary skill in the art.

[0150] It is understood that use in combination includes use with other therapies, drugs, medical procedures etc., where the other therapy or procedure may be administered at different times (e.g. within a short time, such as within hours (e.g. 1, 2, 3, 4-24 hours), or within a longer time (e.g. 1-2 days, 2-4 days, 4-7 days, 1-4 weeks)) than a compound of Formula I, or at the same time as a compound of Formula I. Use in combination also includes use with a therapy or medical procedure that is administered once or infrequently, such as surgery, along with a compound of Formula I administered within a short time or longer time before or after the other therapy or procedure. In some embodiments, the present invention provides for delivery of a compound of Formula I and one or more other drug therapeutics delivered by a different route of administration or by the same route of administration. The use in combination for any route of administration includes delivery of a compound of Formula I and one or more other drug therapeutics delivered by the same route of administration together in any formulation, including formulations where the two compounds are chemically linked in such a way that they maintain their therapeutic activity when administered. In one aspect, the other drug therapy may be co-administered with a compound of Formula I. Use in combination by co-administration includes administration of co-formulations or formulations of chemically joined compounds, or administration of two or more compounds in separate formulations within a short time of each other (e.g. within an hour, 2 hours, 3 hours, up to 24 hours), administered by the same or different routes. Co-administration of separate formulations includes co-administration by delivery via one device, for example the same inhalant device, the same syringe, etc., or administration from separate devices within a short time of each other. Co-formulations of a compound of Formula I and one or more additional drug therapies delivered by the same route includes preparation of the materials together such that they can be administered by one device, including the separate compounds combined in one formulation, or compounds that are modified such that they are chemically joined, yet still maintain their biological activity. Such chemically joined

compounds may have a linkage that is substantially maintained *in vivo*, or the linkage may break down *in vivo*, separating the two active components.

EXAMPLES

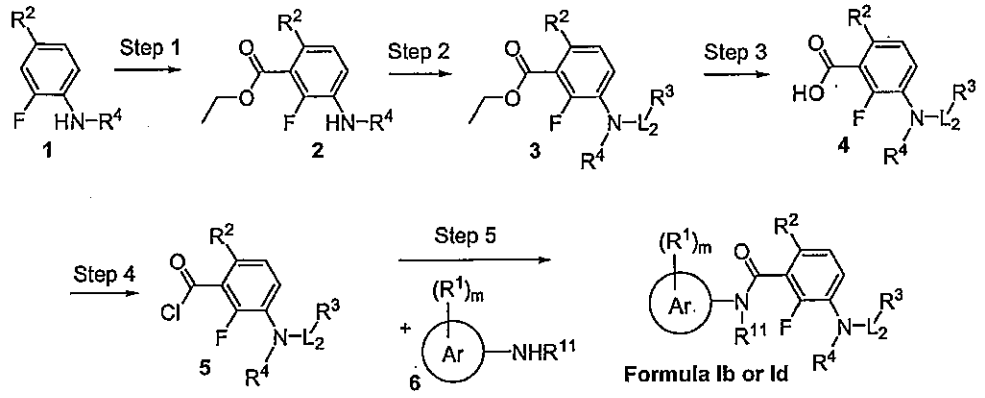

[0151] Examples related to the present invention are described below. In most cases, alternative techniques can be used. The examples are intended to be illustrative and are not limiting or restrictive to the scope of the invention. In some examples, the mass spectrometry result indicated for a compound may have more than one value due to the isotope distribution of an atom in the molecule, such as a compound having a bromo or chloro substituent.

[0152] Unless specifically indicated otherwise, the Formula enumeration and R group enumeration used in the following examples is not related to such enumeration in other sections of this application. The reagents and solvents used in these examples can be readily substituted with appropriate alternatives as are known in the art and isolation of products is readily achieved by methods known in the art, including, but not limited to, extraction, crystallization, and chromatographic methods.

Example 1: Synthesis of compound of Formula Ib or Id wherein A is -C(O)-.

[0153] Compounds of Formula Ib or Id, as defined in paragraphs **[0010]** and **[0016]**, respectively, wherein A is -C(O)-, can be prepared in five steps as described in Scheme 1.

Scheme 1

Step 1 - Synthesis of compound 2:

[0154] Compound **1** (R^2 and R^4 as defined in paragraph **[0004]**) is dissolved in an anhydrous solvent (e.g. tetrahydrofuran) under nitrogen atmosphere. The solution is cooled down with the aid of a dry ice and acetone bath. To this solution is added a base (e.g. n-butyllithium), followed by 1, 2-bis(chlorodimethylsilyl)ethane at low temperature (typically below -70 °C). The resulting mixture is stirred at low temperature for 1-2 hours. To this solution is added a base (e.g. n-butyllithium),

followed by ethyl chloroformate. The resulting mixture is allowed to warm to room temperature and then stirred at room temperature for 1-3 days. The reaction mixture is quenched by an acid solution, stirred at room temperature for a couple of hours, and then basified. The mixture is extracted with an organic solvent (e.g. dichloromethane or ethyl acetate). The desired compound **2** is purified by chromatography.

Step 2 - Synthesis of compound 3:

[0155] To compound **2** in an organic solvent (e.g. dichloromethane) is added pyridine, followed by an appropriate acylating agent, isocyanate, or sulfonyl chloride such as propane-1-sulfonylchloride. The reaction mixture is stirred at room temperature for over 12 hours and the mixture is then poured into water. The organic layer is separated and the aqueous layer is extracted with an appropriate organic solvent (e.g. dichloromethane). The desired compound **3** (L_2 and R^3 as defined in paragraph **[0004]**, or L_2 is $S(O)_2$ for Formula Ib) is purified by chromatography.

Step 3 - Synthesis of compound 4:

[0156] To compound **3** in a solvent mixture (e.g. tetrahydrofuran and water) is added a base (e.g. lithium hydroxide or sodium hydroxide). The resulting suspension is stirred in a heated oil bath for over 10 hours. The reaction mixture is cooled down to room temperature and then acidified with an acid solution such as concentrated hydrochloric acid. The aqueous layer is separated and extracted with an appropriate organic solvent (e.g. ethyl acetate). The desired compound **4** is purified by chromatography.

Step 4 - Synthesis of compound 5:

[0157] To a suspension of compound **4** in an anhydrous solvent (e.g. dichloromethane), cooled with an ice and water bath, oxalyl chloride is added slowly, followed by dimethylformamide. The reaction mixture is stirred at room temperature for a few hours. After removal of the solvent and excess oxalyl chloride, the residue is used in the next step without further purification.

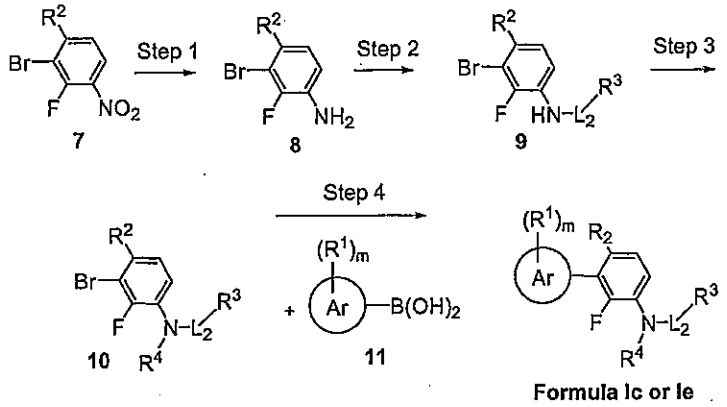

Step 5 - Synthesis of compound of Formula Ib or Id:

[0158] To an appropriate amine **6** (Ar, m, R^1 and R^{11} as defined in paragraph **[0004]**) in an anhydrous solvent (e.g. tetrahydrofuran) is added a base (e.g. triethylamine). To this mixture, cooled with an ice and salt bath, a solution of compound **5** in an anhydrous solvent (e.g. tetrahydrofuran) is added slowly. The resulting mixture was stirred at room temperature for over 12 hours. The desired compound of Formula Ib (L_2 is $S(O)_2$) or Id is purified by chromatography.

Example 2: Synthesis of compound of Formula Ic or Ie.

[0159] Compounds of Formula Ic or Ie, as defined in paragraphs **[0014]** and **[0020]**, respectively, can be prepared in four steps as described in Scheme 2.

Scheme 2

Step 1 - Synthesis of compound 8:

[0160] Compound **7** (R^2 as defined in paragraph **[0004]**) is dissolved in an appropriate solvent (e.g. methanol). To this solution is added catalyst (e.g. palladium on carbon). The suspension is then placed under a hydrogen atmosphere and shaken at room temperature for over 12 hours. The catalyst is removed by filtration on a pad of celite and washed with an appropriate solvent (e.g. methanol). The filtrate is concentrated under reduced pressure to give compound **8**, which is used in the next step without further purification.

Step 2 - Synthesis of compound 9:

[0161] To compound **8** in an organic solvent (e.g. dichloromethane) is added a base (e.g. pyridine) followed by an appropriate acylating agent, isocyanate, or sulfonyl chloride. The reaction mixture is stirred at room temperature for over 12 hours. The reaction mixture is then poured into water. The organic layer is collected and the aqueous layer is extracted with an appropriate organic solvent (e.g. dichloromethane). The organic solvents are then combined. The desired compound **9** (L_2 and R^3 as defined in paragraph **[0004]**, or L_2 is $S(O)_2$ for Formula Ic) is purified by chromatography.

Step 3 - Synthesis of compound 10:

[0162] To compound **9** in an organic solvent (e.g. tetrahydrofuran or dichloromethane) is added a base (e.g. sodium hydride) at low temperature, followed by an appropriate alkylating agent (e.g. halide). The reaction mixture is stirred at room temperature or heated in an oil bath as necessary, for a few hours. The reaction mixture is then poured into water. The organic layer is collected and the aqueous layer is extracted with an appropriate organic solvent (e.g. ethyl acetate or dichloromethane). The organic solvents are then combined. The desired compound **10** (R^4 as defined in paragraph **[0004]**) is purified by chromatography.

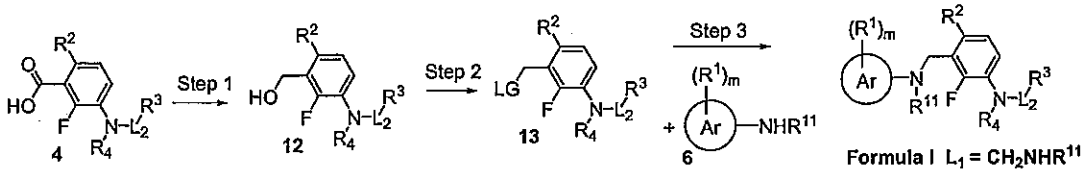

Step 4 - Synthesis of compound of Formula Ic or Ie:

[0163] A mixture of compound 10, an appropriate boronic acid 11 (Ar, m and R^1 as defined in paragraph [0004]), and a catalyst (e.g. tetrakis(triphenylphosphine)palladium) in a mixture of base (e.g. aqueous solution of potassium carbonate) and an appropriate organic solvent (e.g. acetonitrile) is heated in an oil bath or is irradiated in a microwave system at over 100°C for an appropriate time depending on starting materials. The reaction mixture is poured into water and then extracted with an appropriate organic solvent (e.g. dichloromethane or ethyl acetate). The organic solvents are then combined. The desired compound of Formula Ic (L_2 is $S(O)_2$) or Id is purified by chromatography.

Example 3: Synthesis of compound of Formula I where L_1 is $-CH_2NR^{11}-$.

[0164] Compounds of Formula I, as defined in paragraph [0004] where L_1 is $-CH_2NR^{11}-$, can be prepared in three steps as described in Scheme 3 – Method A, or one step as described in Scheme 3 – Method B.

Scheme 3 – Method A

Step 1 - Synthesis of compound 12:

[0165] Compound 4 (prepared as described in Scheme 1, Step 3 in Example 1) is dissolved in an appropriate solvent (e.g. tetrahydrofuran). To this solution is added an appropriate reducing agent (e.g. lithium tetrahydroaluminate) at low temperature (typically below -30°C). The reaction mixture is then stirred at room temperature for 2-24 hours. Sodium sulfate is added and the mixture is stirred at room temperature for 30 minutes. The mixture is filtered through a pad of celite and washed with an appropriate solvent (e.g. ethyl acetate). The filtrate is concentrated under reduced pressure to give compound 12, which is used in the next step without further purification.

Step 2 - Synthesis of compound 13:

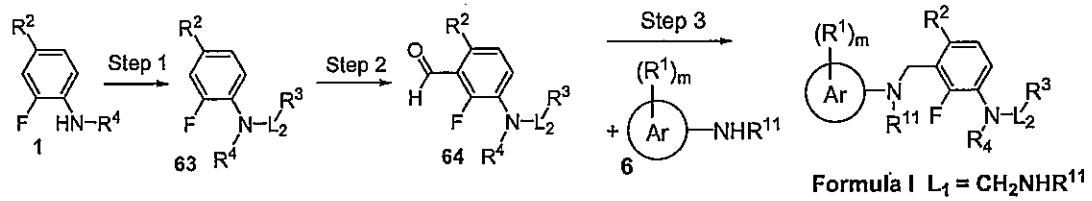

[0166] Compound 13 (LG is a suitable leaving group) is prepared by converting compound 12 into a mesylate or triflate by reacting with the corresponding sulfonyl chloride in an appropriate organic solvent. It can also be converted into the corresponding bromide by reacting with an appropriate agent (e.g. phosphorous tribromide) in the presence of an appropriate base (e.g. pyridine).

Step 3 - Synthesis of compound of Formula I where L_1 is $-CH_2NR^{11}-$:

[0167] To a mixture of compound 13 and a base (e.g. cesium carbonate) in an appropriate organic solvent (e.g. acetonitrile), amine 6 is added. The reaction mixture is stirred at room temperature, or

heated in an oil bath if necessary, for 2-24 hours. The reaction mixture is poured into water and then extracted with an appropriate organic solvent (e.g. dichloromethane or ethyl acetate). The organic solvents are then combined. The desired compound of Formula I is purified by chromatography.

Scheme 3 – Method B

Step 1 - Preparation of compound 63:

[0168] To substituted phenylamine **1** (R^2 and R^4 as defined in paragraph **[0004]**) in an appropriate solvent (e.g. tetrahydrofuran) are added a base (e.g. triethylamine) and acid halide (e.g. acid chloride or sulfonyl chloride) in an appropriate organic solvent under an atmosphere of nitrogen. The reaction is stirred at room temperature for 2-24 hours. The reaction mixture is then poured into an acid solution and extracted with an appropriate organic solvent (e.g. dichloromethane or ethyl acetate). The organic layers are combined. The desired compound **63** (L_2 and R^3 as defined in paragraph **[0004]**) is purified by crystallization or chromatography.

Step 2 - Preparation of compound 64:

[0169] Compound **63** in an appropriate solvent (e.g. tetrahydrofuran) under an atmosphere of nitrogen is cooled in an acetone/dry ice bath. To this solution is added a base (e.g. lithium diisopropylamide) and then an appropriate reagent (e.g. N,N-dimethyl-formamide). The reaction mixture is stirred for 0.5 to 3 hours at low temperature (<50 °C) and then allowed to warm to room temperature. The reaction mixture is poured into water and extracted with an appropriate organic solvent (e.g. dichloromethane or ethyl acetate). The desired compound **64** is purified by chromatography.

Step 3 - Synthesis of compound of Formula I where L_1 is $-CH_2NR^{11}-$:

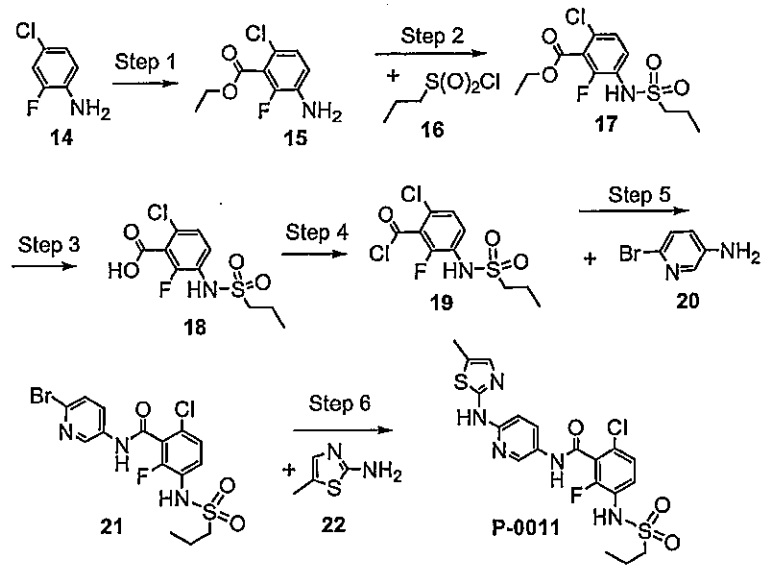

[0170] To a mixture of compound **64** in an appropriate organic solvent (e.g. acetonitrile) is added amine **6** (Ar, m, R^1 and R^{11} as defined in paragraph **[0004]**), and reducing agent (e.g. triethylsilane and trifluoroacetic acid). The reaction mixture is heated in an oil bath for 2-24 hours. The reaction mixture is concentrated, poured into water and then extracted with an appropriate organic solvent (e.g. dichloromethane or ethyl acetate). The organic layers are then combined. The desired compound of Formula I is purified by chromatography.

[0171] Alternatively, compounds of Formula I where L_1 is $-CH_2NR^{11}-$ may be prepared by reduction of compounds of Formula Ib or Id wherein A is -C(O)- (e.g. prepared as described in Example 1) with an appropriate reducing agent (e.g. borane or diisobutylaluminum hydride).

Scheme 4

Step 1 – Preparation 3-amino-6-chloro-2-fluorobenzoic acid ethyl ester (15):

[0173] 4-Chloro-2-fluoroaniline (**14**, 12 mL) was dissolved in 200 mL of anhydrous tetrahydrofuran under a nitrogen atmosphere in a 1 L 3-neck round bottom flask. The mixture was cooled to -78 °C (dry ice/acetone bath) and n-butyllithium (2.5 M, 45 mL) was slowly added dropwise, maintaining the temperature below -70 °C. The mixture was stirred at -70 °C for 30 minutes. 1,2-Bis(chlorodimethylsilyl)ethane (24.80 g) was dissolved in 80 mL of anhydrous tetrahydrofuran and slowly added dropwise to the reaction mixture while maintaining the temperature below -70 °C. The resulting mixture was stirred at -78 °C for 1 hour, then n-butyllithium (2.5 M, 45 mL) was slowly added dropwise maintaining the temperature below -70 °C. The mixture was then stirred for 30 minutes at -78 °C, then warmed up to 15 °C over 1 hour. The reaction mixture was cooled down to -78 °C and n-butyllithium (2.5 M, 50 mL) was slowly added dropwise maintaining the temperature below -70 °C. The mixture was stirred at -70 °C for 90 minutes, then 13.40 mL of ethylchloroformate

was slowly added dropwise maintaining the temperature below -70 °C. The reaction mixture was slowly warmed to room temperature and stirred at room temperature for 64 hours. The reaction was quenched by careful addition of a solution of 50 mL of concentrated hydrochloric acid in 160 mL of water while cooling with an ice/water bath. The mixture was stirred at room temperature for 2 hours, then made basic by addition of potassium carbonate. The mixture was extracted with 3 x 100 mL of ethyl acetate and the combined organic extracts were washed with 50 mL of brine and dried with magnesium sulfate. After removal of the solvent, the residue was purified with silica gel column chromatography eluting with ethyl acetate in hexane to provide the desired compound (**15**, 17 g, 72 %).

Step 2 – Preparation 6-chloro-2-fluoro-3-(propane-1-sulfonylamino)-benzoic acid ethyl ester (17):

[0174] 3-Amino-6-chloro-2-fluorobenzoic acid ethyl ester (**15**, 17 g) was dissolved in 785 mL of dichloromethane, to which 13.2 mL of pyridine was added, followed by propane-1-sulfonylchloride (**16**, 12.8 g). The reaction mixture was stirred at room temperature for 18 hours, then poured into 400 mL of water. The organic layer was separated and the aqueous layer was extracted with 200 mL of dicholormethane. The combined organic extracts were dried over magnesium sulfate to give an orange oil (41 g). Trituration in 150 mL of diethylether removed the pyridine salt as a white solid. The ether filtrate was concentrated to give orange oil, which was purified with silica gel column chromatography eluting with ethyl acetate in hexane to provide the desired compound as a pale yellow solid (**17**, 20 g, 57 %).

Lithium hydroxide (12.95 g) was added and the resulting suspension was stirred at 90 °C for 17 hours. The mixture was cooled down to room temperature, then brought to pH = 1 with concentrated hydrochloric acid (~36 mL). The aqueous layer was separated and extracted with 3 x 400 mL of ethyl acetate. The combined organic extracts were dried over magnesium sulfate and concentrated to give a beige solid (25 g). The solid was triturated in 100 mL of diethyl ether for 30 minutes, filtered, washed with 50 mL of diethyl ether and dried to provide the desired compound as a white solid (**18**, 16 g, 87 %).

[0193] Pyrrolidine-1-carboxylic acid {5-[6-chloro-2-fluoro-3-(propane-1-sulfonylamino)-benzoylamino]-pyridin-2-yl}-amide **P-0006** was synthesized in four steps from 2-amino-5-nitro-pyridine **34** as shown in Scheme 8.

Scheme 8

Step 1 – Preparation (5-nitro-pyridin-2-yl)-carbamic acid isopropenyl ester (35):

[0194] 2-Amino-5-nitro-pyridine (**34**, 500 mg) was dissolved in 5 mL of anhydrous tetrahydrofuran. N-Methyl morpholine (436 mg, 1.2 eq) was added and the mixture cooled to -10 °C in an ice/salt acetone bath. A solution of isopropenyl chloroformate (520 mg) in 5 mL of tetrahydrofuran was then slowly added dropwise while maintaining the temperature below -10 °C. The reaction mixture was stirred at room temperature overnight, then diluted with 25 mL of ethyl acetate and 20 mL of water. The aqueous layer was separated and extracted with 2 x 25 mL of ethyl acetate. The combined organic extracts were washed with 25 mL of half saturated brine and dried over magnesium sulfate. After removal of the solvent, the residue was purified with silica gel column chromatography eluting with ethyl acetate in hexane to provide the desired compound as a white solid (**35**, 0.52 g, 65 %).

Step 2 – Preparation of pyrrolidine-1-carboxylic acid (5-nitro-pyridin-2-yl)-amide (37):

[0195] (5-Nitro-pyridin-2-yl)-carbamic acid isopropenyl ester (**35**, 160 mg) was dissolved in 2 mL of anhydrous tetrahydrofuran. N-Methylpyrrolidine (6 mg, 0.1 eq) was added, followed by pyrrolidine (**36**, 51 mg, 1 eq). The mixture was stirred at room temperature overnight, forming a precipitate. The precipitate was filtered off, washed with 1 mL of tetrahydrofuran and dried to give a white solid. Additional compound was obtained by concentration of the filtrate under reduced pressure and trituration of the residue in diethyl ether (~5 mL) to provide the desired compound as a beige solid (**37**, 0.12 g, 71 %).

Step 3 – Preparation of pyrrolidine-1-carboxylic acid (5-amino-pyridin-2-yl)-amide (38):

[0196] Pyrrolidine-1-carboxylic acid (5-nitro-pyridin-2-yl)-amide (**37**, 115 mg) was dissolved in 10 mL of methanol. [0228] 2,6-Difluoro-3-nitrobenzoic acid **60** is converted to 2,6-difluoro-3-nitro-phenylamine **61** following the methods described in Scheme 15, Step 3.

Step 2 – Preparation of compound 62:

[0229] 2,6-Difluoro-3-nitro-phenylamine **61** is reacted with compound **55** following the methods described in Scheme 15, Step 4 to provide the desired compound **62**.

Step 3 – Preparation of compound 57:

[0230] To compound **62** in ethanol and tetrahydrofuran, ~3 cc of raney nickle slurry in water is added. The reaction is placed in a parr hydrogenator under hydrogen at 35 psi and monitored by TLC until all starting material is consumed. The reaction is filtered and all volatile solvents are removed to provide the desired compound as a crude solid.
